1. PRODUCT NAME

Hitachi Brush Cutter, Models CG 23EA (SL), CG 32EA, CG 32EA (SL), CG 42EA, CG 42EA (SL), CG 51EA, CG 51EA (SL)

2. MARKETING OBJECTIVE

A four-model (seven kinds of specifications) series of brush cutters will be put on the European markets as our first engine-driven tools. The table below shows the engine displacement and the handle shape of each model.

Model	Engine displacement	Handle shape	Standard accessory	Main application
CG 23EA (SL)	22.5 mL	Loop type	Nylon string trimmer	For general and semi-professional use
CG 32EA	31.8 mL	Offset type		
CG 32EA (SL)		Loop type		
CG 42EA	41.5 mL	Offset type	4-teeth x 255 mm cutter blade for grass cutting	For professional use
CG 42EA (SL)		Loop type		
CG 51EA	50.2 mL	Offset type	Nylon string trimmer	
CG 51EA (SL)		Loop type		

All the models comply with the CE regulation on exhaust gas emission (stage 1).

Compliance period: CG 23EA (SL), CG 32EA, CG 32EA (SL) ... Up to 2006

CG 42EA, CG 42EA (SL), CG 51EA, CG 51EA (SL) ... Up to 2009

Please promote the sales of these models vigorously.

3. APPLICATIONS

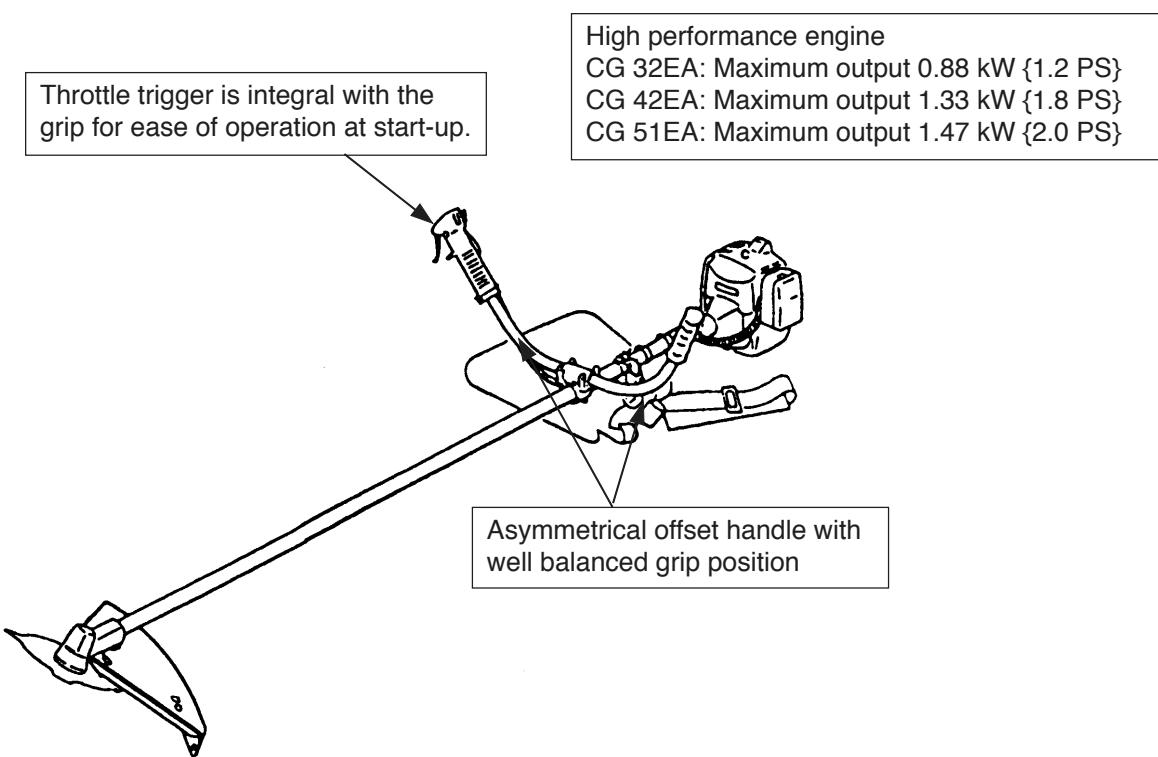

Nylon string trimmer: Specifically designed for cutting grass

4-teeth x 255 mm cutter blade for grass cutting: Specifically designed for cutting grass and brush

4. SELLING POINTS

(1) Brush cutter Models CG 32EA, CG 42EA and CG 51EA

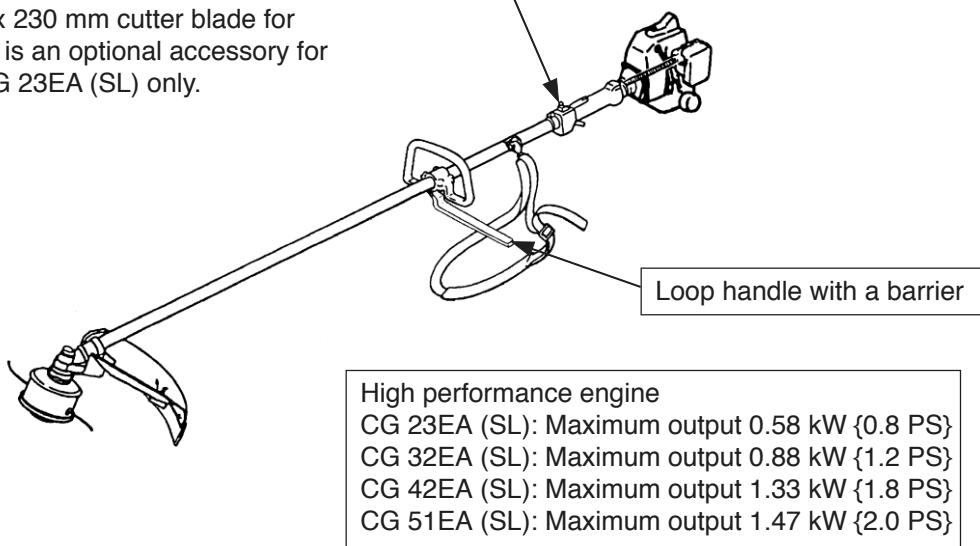

[Representative model: CG 32EA]

(2) Brush cutter Models CG 23EA (SL), CG 32EA (SL), CG 42EA (SL) and CG 51EA (SL)

[Representative model: CG 32EA (SL)]

* The 4-teeth x 230 mm cutter blade for grass cutting is an optional accessory for the Model CG 23EA (SL) only.

4-1. Selling Point Descriptions

(1) Models CG 32EA, CG 42EA and CG 51EA

① Throttle trigger is integral with the grip for ease of operation at start-up

Keeping the trigger lever and the throttle trigger depressed simultaneously, press the stop switch button at cold start. Then release the trigger lever and the throttle trigger, and the throttle trigger is positioned at fast-idle start position. Thus initial combustion is easily made for ease of operation at start-up.

② Asymmetrical offset handle with well balanced grip position

The asymmetrical offset handle is ergonomically designed for a well balanced grip position. The Models CG 32EA, CG 42EA and CG 51EA are convenient for cutting grass.

③ High performance engine

Thanks to the high performance engine, the Models CG 32EA, CG 42EA and CG 51EA have excellent cutting capacity.

Model CG 32EA: Engine displacement 31.8 mL, maximum output 0.88 kW {1.2 PS}

Model CG 42EA: Engine displacement 41.5 mL, maximum output 1.33 kW {1.8 PS}

Model CG 51EA: Engine displacement 50.2 mL, maximum output 1.47 kW {2.0 PS}

(2) Models CG 23EA (SL), CG 32EA (SL), CG 42EA (SL) and CG 51EA (SL)

① Throttle trigger is integral with the grip for ease of operation at start-up

Keeping the trigger lever and the throttle trigger depressed simultaneously, press the stop switch button at cold start. Then release the trigger lever and the throttle trigger, and the throttle trigger is positioned at fast-idle start position. Thus initial combustion is easily made for ease of operation at start-up.

② Loop handle with a barrier

In the event the brush cutter is turned around unexpectedly due to a kickback etc., the barrier keeps the blade from contact with the operator.

③ High performance engine

Thanks to the high performance engine, the Models CG 23EA (SL), CG 32EA (SL), CG 42EA (SL) and CG 51EA (SL) have excellent cutting capacity.

Model CG 23EA (SL): Engine displacement 22.5 mL, maximum output 0.58 kW {0.8 PS}

Model CG 32EA (SL): Engine displacement 31.8 mL, maximum output 0.88 kW {1.2 PS}

Model CG 42EA (SL): Engine displacement 41.5 mL, maximum output 1.33 kW {1.8 PS}

Model CG 51EA (SL): Engine displacement 50.2 mL, maximum output 1.47 kW {2.0 PS}

5. SPECIFICATIONS

Item	Model	CG 23EA (SL)	CG 32EA	CG 32EA (SL)	CG 42EA	CG 42EA (SL)	CG 51EA	CG 51EA (SL)
Type of engine					Two-cycle, air-cooled gasoline engine			
Engine displacement		22.5 mL		31.8 mL		41.5 mL		50.2 mL
Engine displacement		22.5 mL		31.8 mL		41.5 mL		50.2 mL
Bore size x stroke		32 mm dia. x 28 mm		38 mm dia. x 28 mm		40 mm dia. x 33 mm		44 mm dia. x 33 mm
Max. power output		0.58 kW {0.8 PS}/7,000 min ⁻¹		0.88 kW {1.2 PS}/6,500 min ⁻¹		1.33 kW {1.8 PS}/6,500 min ⁻¹		1.47 kW {2.0 PS}/6,500 min ⁻¹
Fuel					Mixed fuel of gasoline and two-cycle oil at 25 to 50 : 1			
Fuel tank capacity		0.55 liters				1.0 liters		
Ignition system					Point-less flywheel magnet type (LHIC type)			
Ignition plug					NGK BPMR6Y			
Carburetor					Diaphragm type (with a primer pump)			
Starting					Recoil starter type			
Stopping					Slide type			
Throttle lever					Fixed type			
Clutch					Automatic centrifugal			
Carrying				Shoulder belt type (single)	Shoulder belt type (double)	Shoulder belt type (single)	Shoulder belt type (double)	Shoulder belt type (single)
Cutter blade dimensions		—		—	255 mm-dia. x 1.4 mm-thick x 25.4 mm-bore			
Nylon string trimmer					Semi-automatic head 4 inches type			
Rotating direction of cutter blade					Counterclockwise when viewed from above			
Dimensions	L	1,780 mm		1,860 mm	1,910 mm	1,895 mm	1,910 mm	1,895 mm
[When mounting the 4-teeth blade]	W	350 mm		350 mm	690 mm	350 mm	690 mm	350 mm
	H	320 mm		400 mm	275 mm	425 mm	310 mm	310 mm
Product Weight		4.2 kg		5.6 kg	5.3 kg	7.8 kg	7.0 kg	7.0 kg
[Excluding the mixture of gasoline and oil, cutter blade, nylon string trimmer, hanging strap ass'y and safety guard ass'y]								
Gear reduction ratio		1 : 1.36		1 : 1.46	1 : 1.46	1 : 1.29	1 : 1.29	1 : 1.29
Standard accessories								
Optional accessories								

6. PRECAUTIONS IN SALES PROMOTION

In the interest of promoting the safest and most efficient use of the Brush Cutter by all of our customers, it is very important that at the time of sale the salesperson carefully ensures that the buyer seriously recognizes the importance of the contents of the Handling Instructions, and fully understands the meaning of the precautions listed on the Warning Label attached to each unit.

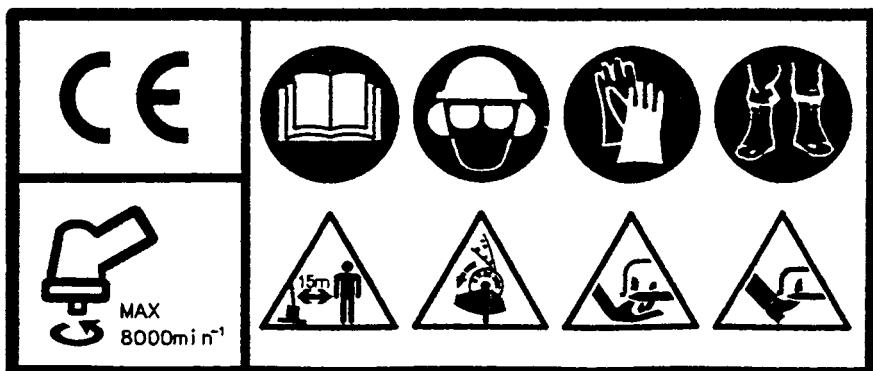

6-1. Handling Instructions

Although every effort is made in each step of design, manufacture and inspection to provide protection against safety hazards, the dangers inherent in the use of any grass cutting machine cannot be completely eliminated. Accordingly, specific precautions and suggestions for the use of the Brush Cutter are listed in the Handling Instructions to enhance the safe and efficient use of the tool by the customer. Salespersons must be thoroughly familiar with the contents of the Handling Instructions to be able to offer appropriate guidance to the customer during sales promotion.

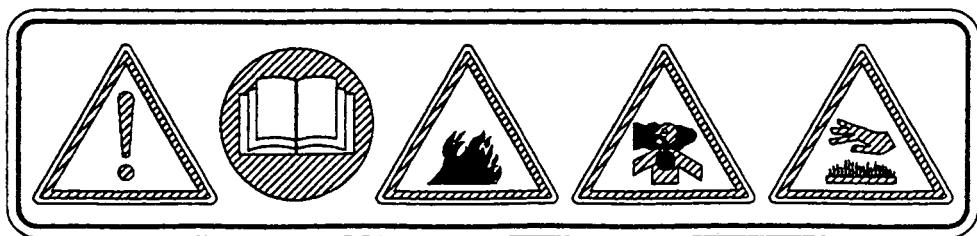

6-2. Warning Label

Each brush cutter is provided with two Warning Labels (illustrated below) which list basic safety precautions in its use.

6-2-1. The following precautions are listed on the Warning Label attached to the drive shaft assembly.

6-2-2. The following precautions are listed on the Warning Label attached to the engine.

6-2-3. Symbol explanation

Read and understand the explanation of each symbol described on the Handling Instructions, and instruct the users properly.

6-3. Thorough Instruction to the Customers

6-3-1. Starting and stopping procedures

Thoroughly instruct the customers especially the difference between the cold starting procedure and the hot restarting procedure, and also the importance of starting with the throttle trigger positioned at fast-idle start position.

6-3-2. Fuel safety

- The engine used on the Models CG 23EA (SL), CG 32EA, CG 32EA (SL), CG 42EA, CG 42EA (SL), CG 51EA and CG 51EA (SL) is of a two-cycle design. Instruct the customers to use a mixture of gasoline and two-cycle oil in the ratio of 25 to 50 : 1 as fuel.
- Instruct the customers to use a container intended for mixing gasoline and oil. Use of resin containers such as poly tanks and PET bottles can cause a failure because they may melt into the mixture.
- Fuel stored for a long time is degraded and deteriorated. In addition, improper capping can degrade the fuel only in one day especially in the summer months. Instruct the customers not to store the mixed fuel but to make the required amount of mixture when necessary.

6-3-3. Storage

Instruct the customers to empty the fuel tank and perform idling until the engine stops to remove any fuel that may remain in the carburetor before long term storage of the Models CG 23EA (SL), CG 32EA, CG 32EA (SL), CG 42EA, CG 42EA (SL), CG 51EA and CG 51EA (SL). If any fuel is remained in the carburetor, only the gasoline mixed in the fuel volatilizes during the storage period and the passage for fuel is clogged with the two-cycle oil. Thus the engine cannot be started next time.

6-3-4. Applicable blade

Thoroughly instruct the customers to use the blades of specified outside diameters and types [the maximum blade diameter for the Model CG 23EA (SL) is 230 mm, and 250 mm for the other models]. Use of an inapplicable blade may result in not only short brush cutter life but also an unexpected accident.

7. TROUBLESHOOTING GUIDE

Problem		Cause	Action
Starter grip cannot be pulled.	Crank shaft does not turn.	Seized piston ring Seized connecting rod bearing	Disassemble and replace.
Engine does not start.	Spark plug is dry.	Empty fuel tank	Replenish with fuel.
		Clogged fuel filter ass'y	Clean or replace.
		Folded or improperly connected or damaged fuel pipe	Check or replace.
		Defective breather ass'y of fuel tank	Replace.
		Clogged carburetor ass'y	Clean.
	No spark is made.	Defective carburetor ass'y	Check or replace.
		Stained or defective spark plug	Clean or replace.
		Improperly connected high tension cable and terminal	Check.
		Damaged high tension cable	Replace.
		Improper air gap	Adjust.
Engine starts but cannot continue idling.	No compression is made.	Defective coil	Replace.
		Defective stop switch	Replace.
		Improperly connected or damaged internal wires	Check or replace.
	Both sparking and compression are proper.	Defective piston ring	Replace.
		Worn piston	
		Defective oil seal of crank chamber	
	Sparking is weak.	Stained or defective spark plug	Clean or replace.
		Improper air gap	Adjust.
		Defective coil	Replace.
	Compression is weak.	Defective piston ring	Replace.
		Defective oil seal of crank chamber	
Engine starts and accelerates but ...	Both sparking and compression are proper.	Clogged carburetor ass'y	Clean.
		Defective carburetor ass'y	Check or replace.
		Clogged fuel filter ass'y	Clean or replace.
	Acceleration is improper. Engine is not revved up.	Folded or improperly connected or damaged fuel pipe	Check or replace.
		Too low idling speed	Adjust.
		Clogged carburetor ass'y	Clean.
	Engine stops.	Defective carburetor ass'y	Check or replace.
		Clogged fuel filter ass'y	Clean or replace.
		Defective carburetor ass'y	Check or replace.
Engine starts but ...	Fuel consumption is excessive.	Clogged muffler with carbon	Clean.
		Clogged element of air cleaner ass'y	Clean.
		Engine speed fluctuates.	Clean.
	Blade rotates at idling speed.	Defective carburetor ass'y	Check or replace.
		Clogged element of air cleaner ass'y	Clean.
		Improper idling adjustment	Adjust.
		Worn clutch section	Replace.

8. REPAIR AND MAINTENANCE GUIDE

This section describes troubleshooting and repair procedures for phenomena which can be expected to occur commonly in the operation of brush cutters. The procedures in this section and in Section 7 TROUBLESHOOTING GUIDE should be studied and referred to regularly to ensure efficient diagnoses and prompt repair of problems.

8-1. Precautions in Maintenance, Inspection and Repair

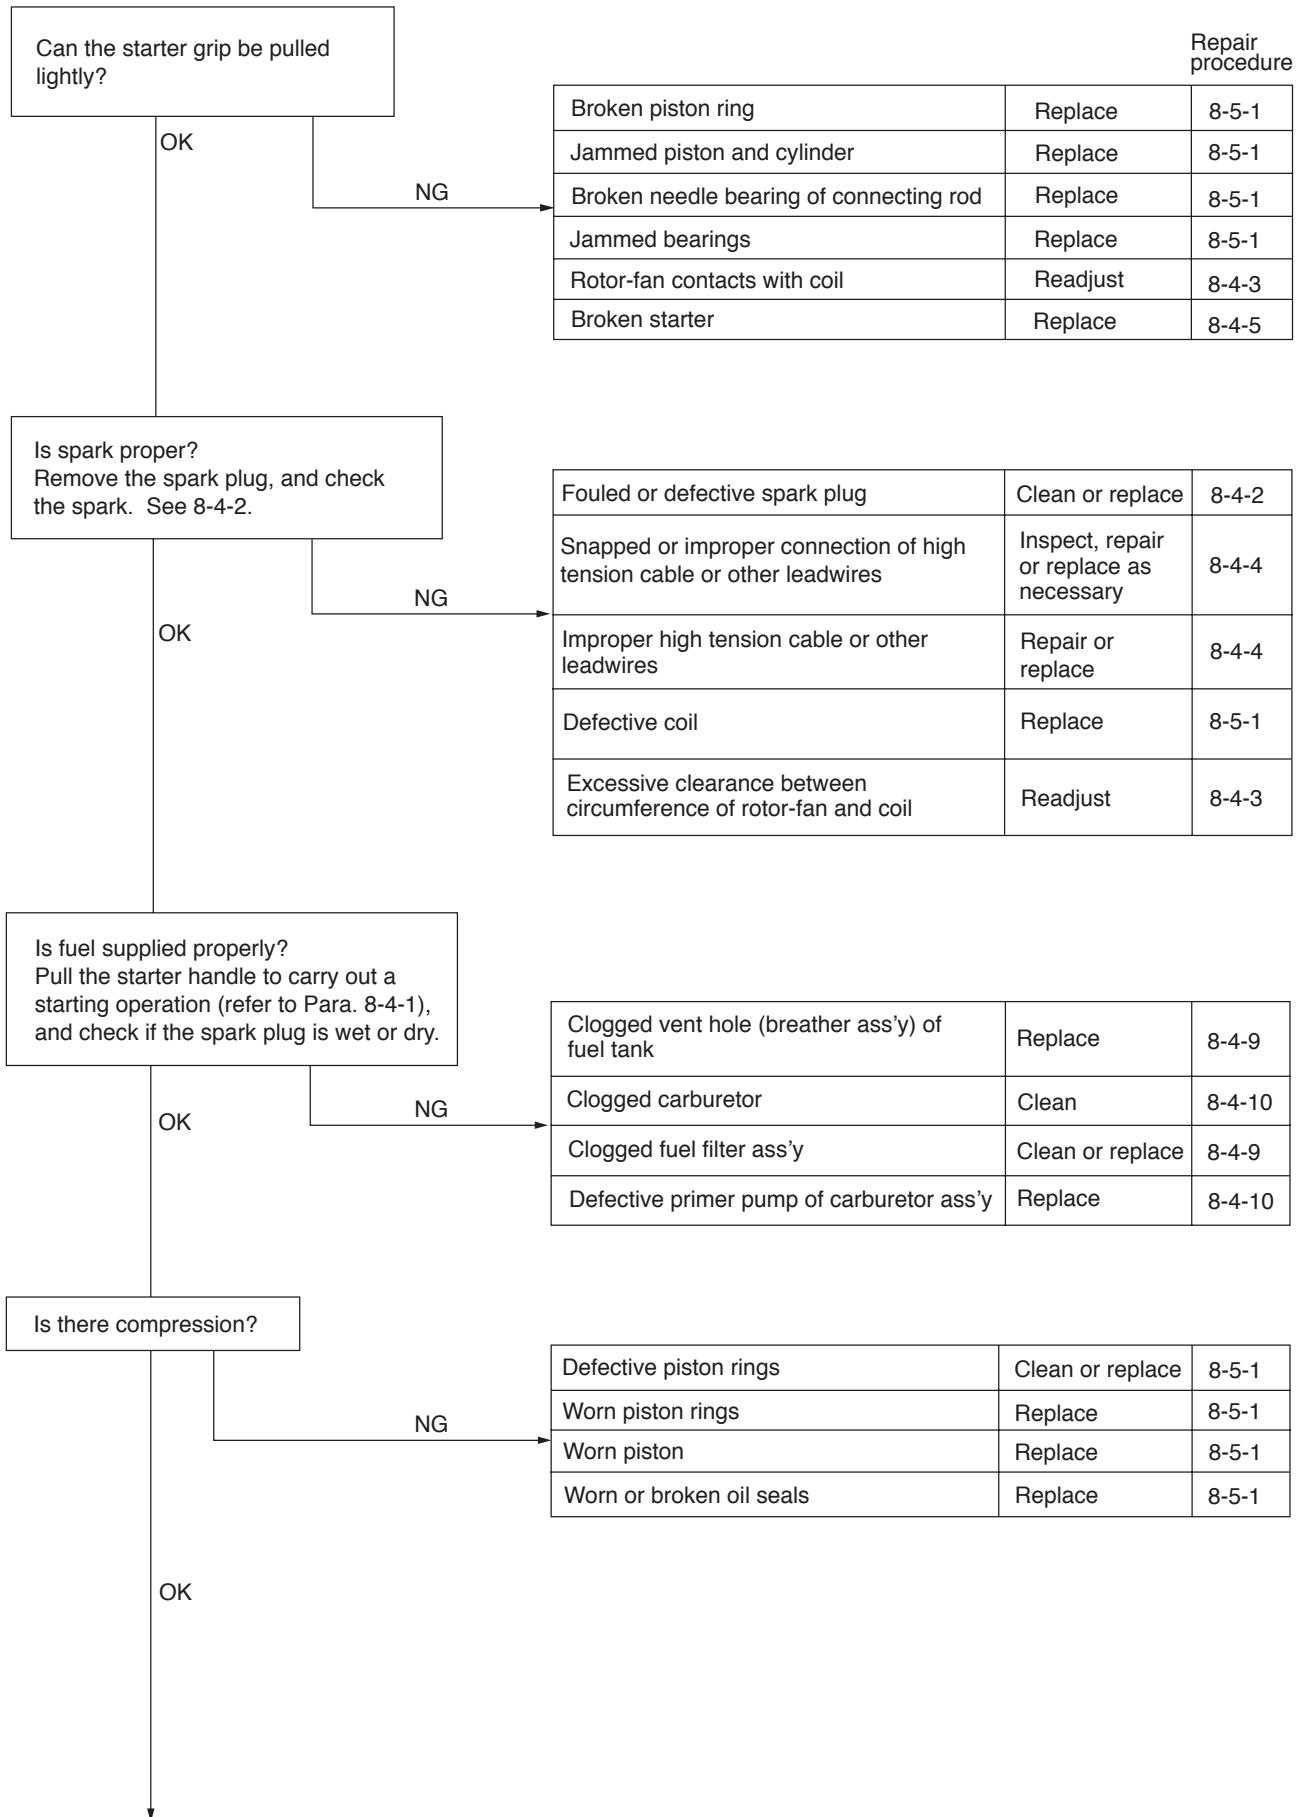

- As the fuel used in the brush cutter is highly flammable, carefully keep sources of fire out of the area.
- If the engine section is disassembled, replace gaskets and oil seals with new ones without fail prior to reassembly.
- Prior to commencing disassembly and repair, thoroughly drain all fuel from the unit into a suitable container.
- Always ensure that the engine has been allowed to cool thoroughly before attempting disassembly.
- When starting, operating or performing maintenance on the unit, carefully avoid coming in contact with hot portions of the muffler and other components, the high tension cable, or the spark plug which could cause serious burn or electrical shock.
- When there is a cutter blade mounted on the unit, carefully confirm that there is no one else in the immediate area before starting the engine.
- When repairing the unit indoors or in other protected areas, carefully ensure there is adequate ventilation.
- On completion of repair, carefully confirm that all screws, nuts and bolts are properly tightened; that the throttle trigger returns properly to the idling position when released; and that the engine stops when the stop switch is slid to the STOP position.

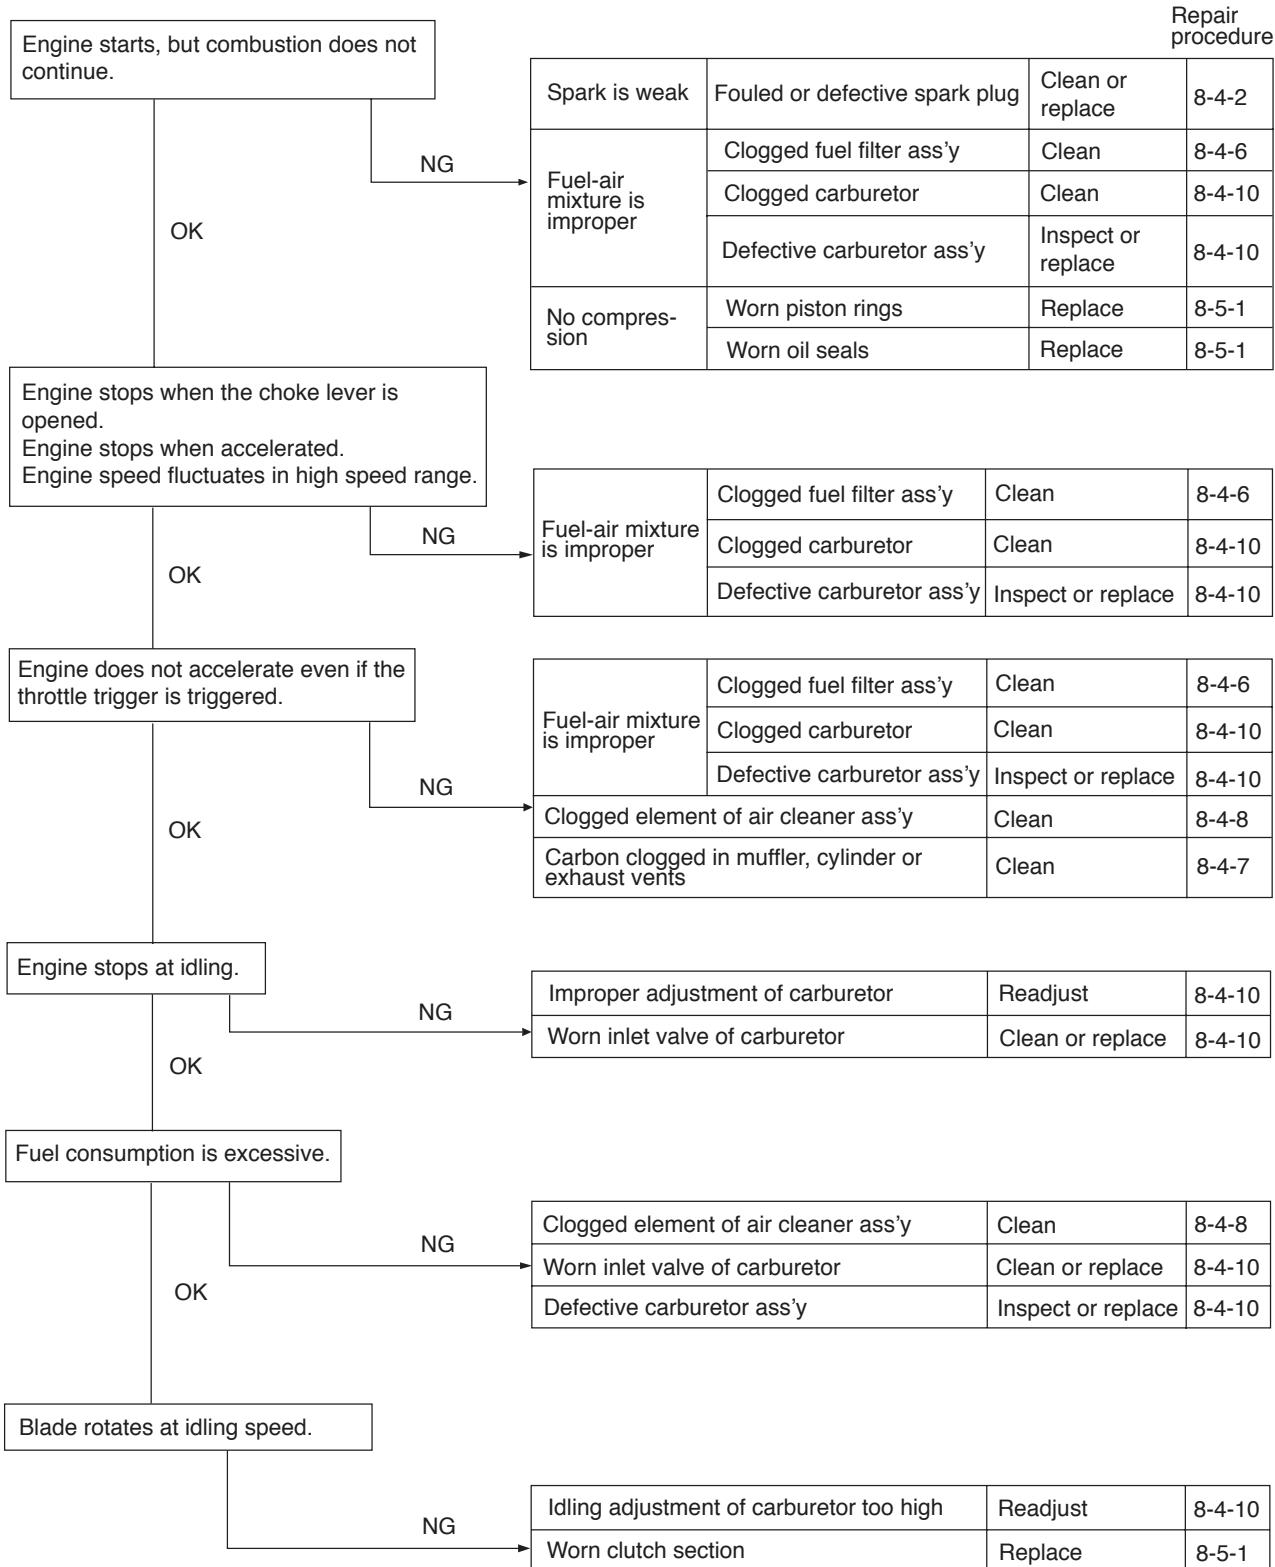

8-2. Inspection Standards and Spark Plug Replacement/Adjustment

The table below can be utilized as a handy guide during and after repair for inspection standards and replacement or adjustment of the spark plug.

Item		Standard value								
Model		CG 23EA (SL)	CG 32EA	CG 32EA (SL)	CG 42EA	CG 42EA (SL)	CG 51EA	CG 51EA (SL)		
Inspection standard	Idling rotation speed	rpm	2,700 to 3,300		2,300 to 2,900					
	No-load max. rotation speed (after warming up) [with 4-teeth cutter blade]	rpm	—	9,000 or more						
	No-load max. rotation speed (after warming up) [with nylon string trimmer]	rpm	7,500 or more							
	Clutch engages	rpm	3,601 to 4,200		3,301 to 3,700					
	Engine acceleration	—	Accelerates smoothly							
	Clearance between the external circumference of flywheel and the ignition coil	mm	0.3 to 0.4							
	Spark plug replacement	—	NGK BPMR6Y							
Spark plug	Clearance between the electrodes of the spark plug	mm	0.6 to 0.7							

8-3. Repair Flow Chart

8-4. Inspection and repair procedures

The **[Bold]** numbers in the description below correspond to the item numbers in the parts list and exploded assembly diagram for the Model CG 32EA, and the **(Bold)** numbers correspond to those for the Model CG 32EA (SL) as representative models.

(Common numbers between the Models CG 32EA and CG 32EA (SL): **[Bold]** numbers)

8-4-1. Starting the engine

A. When the engine is cold:

- (1) Turn the choke lever to the close position (↓↖).
- (2) Pump the primer pump until fuel can be seen flowing through the return pipe to the fuel tank.
- (3) With the stop switch "START" position, and the throttle trigger positioned at Fast-idle start position, pull the starter grip. After the engine is started, turn the choke lever to the open position (↑↖). then squeeze the throttle trigger to allow it to return to the idle position.

If the engine stops running before you turn the choke lever to the open position (↑↖):

Go ahead and open the choke, pull the starter grip with the throttle trigger positioned at Fast-idle start position.

B. When the engine is warm:

To start the engine that is already warmed up (hot restart).

- (1) Turn the choke lever to the open position (↑↖), and set the stop switch to the "START" position.
- (2) Leave the throttle trigger in the idle position and pull the starter grip.
- (3) If the engine fails to start three to four pulls, follow the instructions in the cold starting procedure section above.

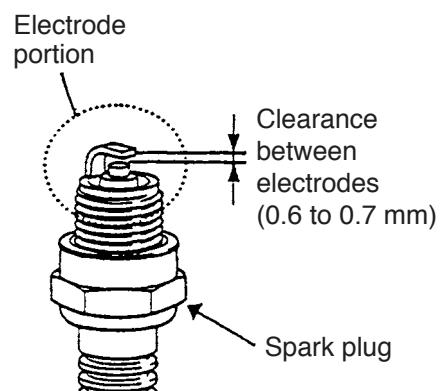

8-4-2. Checking the spark of the spark plug

(1) Remove the spark plug from the cylinder.

If there is any carbon on the electrodes of the spark plug, clean it off thoroughly with a wire brush. If the clearance between the electrodes is improper, readjust it as necessary (see illustration).

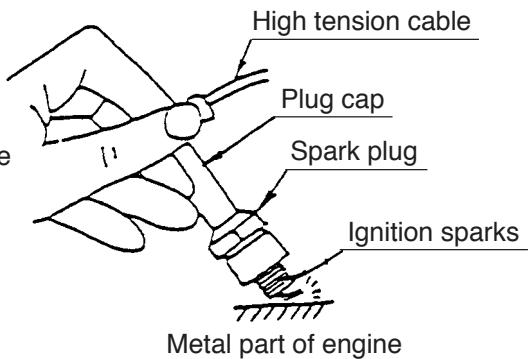

In addition, if the electrodes are wet with fuel, thoroughly wipe the fuel off with a clean, soft rag. Then, remove any fuel which may be remaining in the cylinder by performing the following procedures:

- ① Hold the spark plug away from the cylinder.
- ② Face the spark plug mounting hole of the cylinder downward.
- ③ Pull the starter grip a few times.

(2) Insert the spark plug into the plug cap. Keeping the electrode portion of the spark plug in contact with the metal part of the engine (avoid contacting near the spark plug mounting hole of the cylinder), pull the starter grip.

(3) If the spark plug is functioning properly, there should be sparks from the electrode portion, together with a crackling sound.

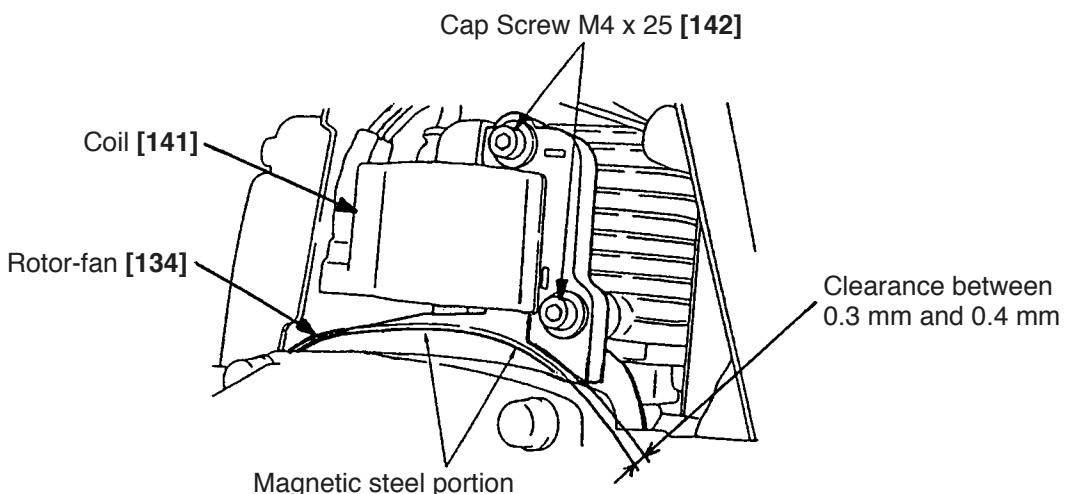

(Avoid contacting near the spark plug mounting hole of the cylinder.)

- WARNING:** ○ When performing the procedures outlined below, should your hand(s) come in contact with metallic portions of the spark plug when the starter grip is pulled, it will give you an electric shock. Be very careful in handling the spark plug.
- Thoroughly wipe up any fuel in the vicinity of the spark plug, and confirm there is no danger of fire before checking the spark.

8-4-3. Adjustment of air gap (clearance) between the rotor-fan perimeter and the coil

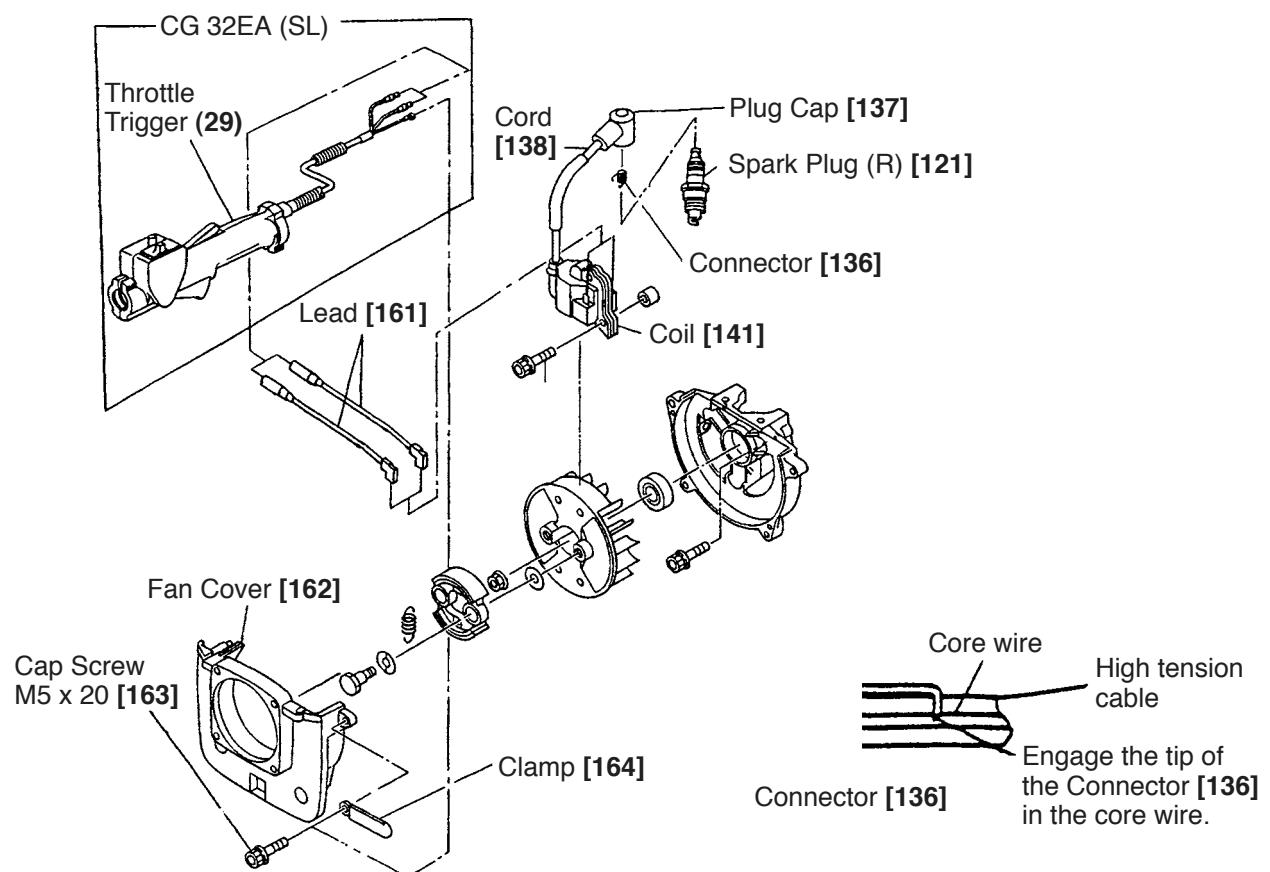

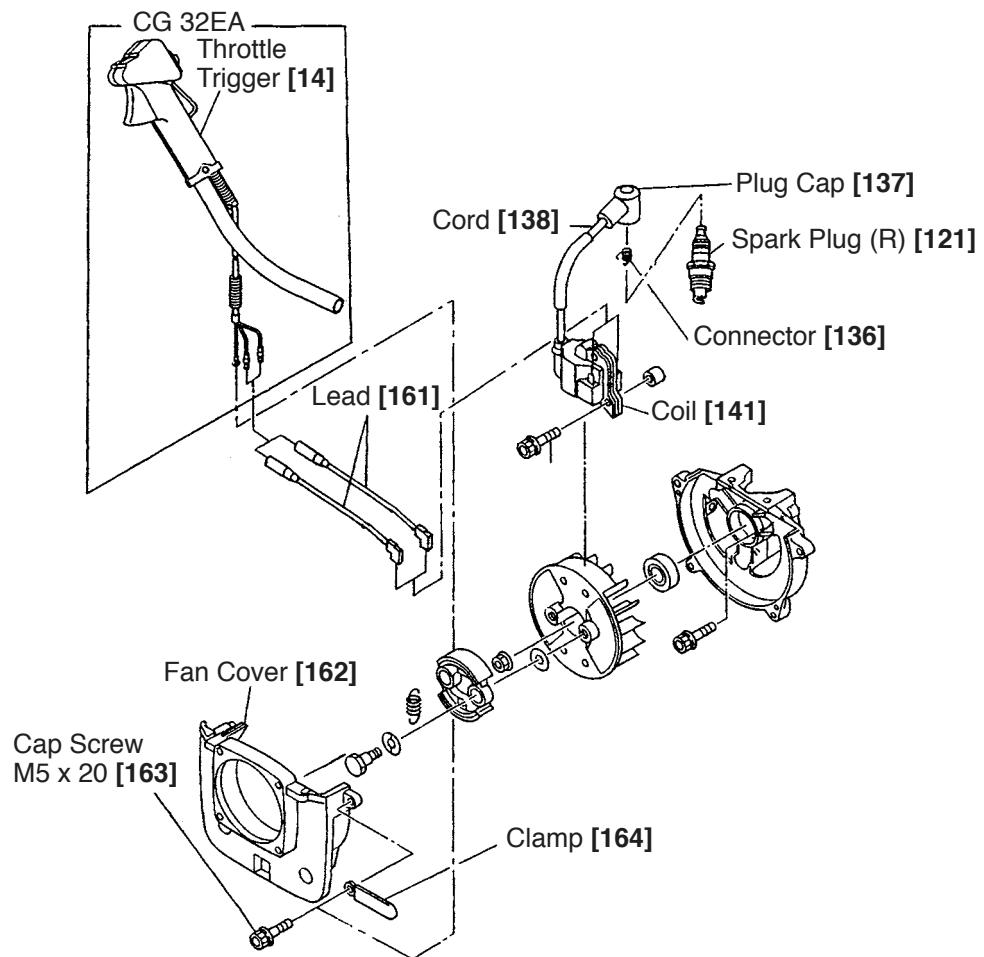

- (1) Remove the Knob [117], Top Cover [118] and Grommet [120].
- (2) Loosen the two Cap Screws M4 x 25 [142] to the extent that the Coil [141] is temporarily secured.
- (3) Insert a clearance gauge between the magnetic steel portion around the perimeter of the Rotor-fan [134] and the Coil [141] then adjust the position of the Coil [141] so that the clearance becomes 0.3 mm to 0.4 mm.
- (4) Tighten the two Cap Screws M4 x 25 [142] and remove the clearance gauge.
- (5) After tightening the Cap Screws M4 x 25 [142] securely, check that the clearance is between 0.3 mm and 0.4 mm.

8-4-4. Wiring diagram

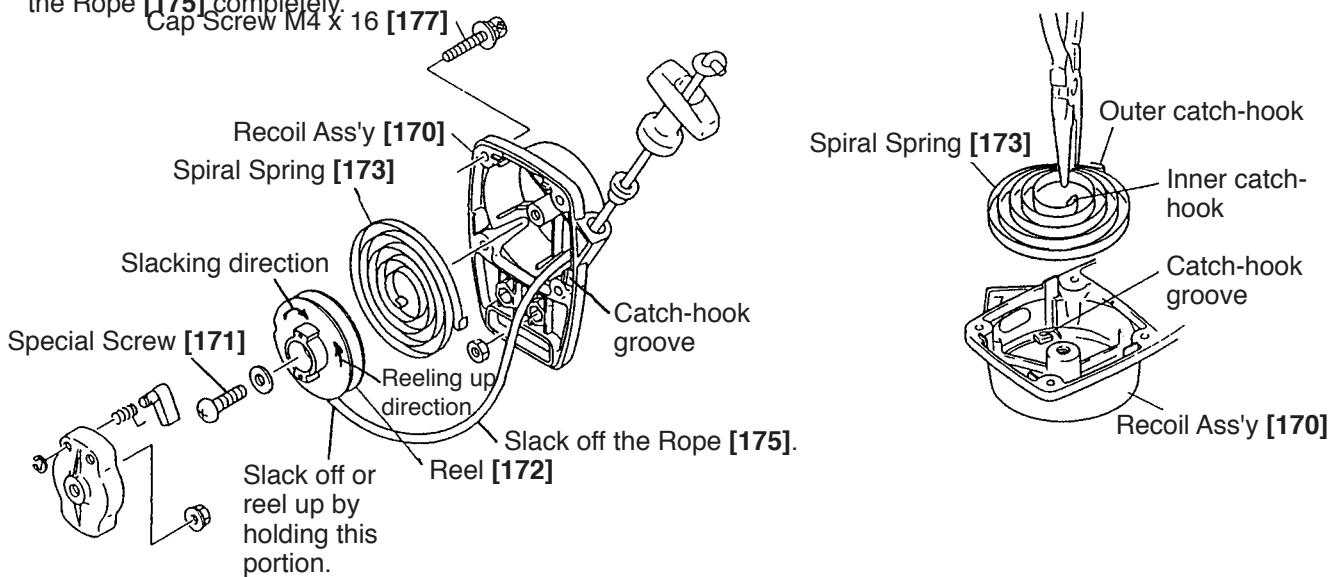

Wiring should be done as shown in the figure below.

Connect the two Leads [161] to the two connectors of the Coil [141]. Connect the two internal wires of the Throttle Trigger [14] (29) to these two Leads [161]. Secure both the remained internal wire of the Throttle Trigger [14] (29) and the Clamp [164] to the Fan Cover [162] with the Cap Screw M5 x 20 [163]. Engage the needle tip of the Connector [136] in the core wire of the Cord [138]. Apply two-cycle oil to the cord mounting hole of the Plug Cap [137] then insert the Cord [138] and the Connector [136] into the hole. After mounting, check for sparking of the Spark Plug (R) [121] and continuity of the Connector [136].

8-4-5. Disassembly and reassembly of the recoil starter ass'y

- (1) Loosen the four Cap Screws M4 x 16 [177] and remove the Recoil Ass'y [170] from the engine.
- (2) Holding the Reel [172] with fingers, slack off the Rope [175] with a screwdriver and hook it on the notch of the Reel [172] then return the Reel [172] slowly until it stops.
- (3) Loosen the Special Screw [171]. Lift the Reel [172] slowly being careful not to pop out the Spiral Spring [173].
- (4) After disassembly, clean dirt from each component completely. Apply grease to the sliding portions before reassembly.
- (5) Insert the outer catch-hook of the Spiral Spring [173] in the groove of the Recoil Ass'y [170].
- (6) Insert the inner catch-hook of the Spiral Spring [173] in the groove of the Reel [172] and tighten the Special Screw [171]. At this time, shape the inner catch-hook of the Spiral Spring [173] with a pair of long-nose pliers for easier reassembly.
- (7) Slack off the Rope [175] from the notch of the Reel [172] inward. Holding the slackened Rope [175], reel up the Spiral Spring [173]. When reeling up, keep 1 or 2 turns of the Spiral Spring [173] slack even after drawing the Rope [175] completely.

8-4-6. Checking the fuel filter

Remove the Fuel Filter [238] from the fuel inlet of the Fuel Tank [241] with a piece of wire. If the Fuel Filter [238] is stained, clean it with gasoline.

Remove the Fuel Filter [238] from the Fuel Pipe [235]. Check whether the Fuel Filter [238] is clogged or not by breathing upon it. Replace the Fuel Filter [238] as necessary.

8-4-7. Cleaning the muffler comp. and the cylinder

Remove the Knob [117], Top Cover [118] and Grommet [120]. Loosen the two Cap Screws M5 x 55 [113] and remove the Muffler Comp. [114].

Clean carbon off the exhaust port of the muffler with a screwdriver. Close the exhaust port of the cylinder with the piston and scrape carbon off the exhaust port.

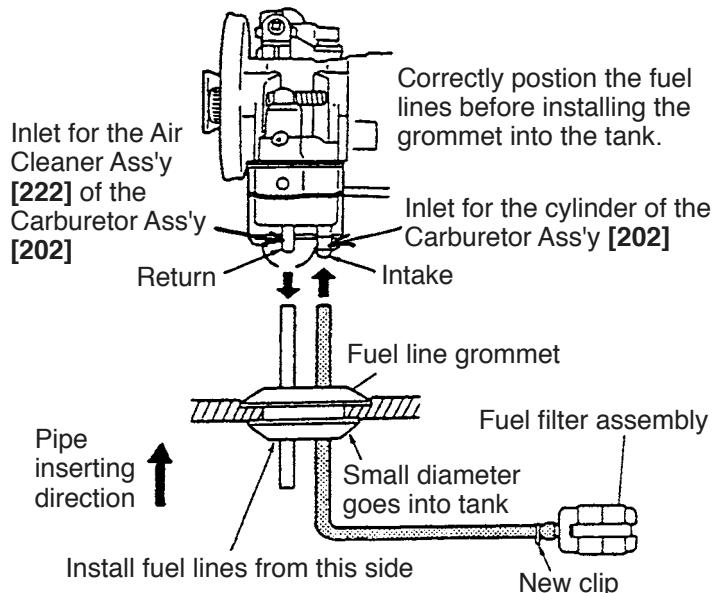

NOTE: Do not scratch the piston.

8-4-8. Cleaning the element

Remove the Air Cleaner Ass'y [222] and the Air Cleaner Cover [229]. Remove the Element [228] and clean it with the compressor air. If the Element [228] is stained heavily, clean it with gasoline and dry it well before reassembly.

8-4-9. Replacement of the fuel pipe

Remove the Fuel Pipe [235] and the Return Pipe 3 x 6 x 85 [237] from the Grommet [236] and replace them with new ones if they are cracked. When inserting the Fuel Pipe [235] into the Grommet [236], insert into the hole that is positioned inside the Fuel Tank [241] first. Insert the Fuel Pipe [235] with the Fuel Filter [238] into the inlet for the cylinder of the Carburetor Ass'y [202]. Insert the yellow Return Pipe 3 x 6 x 85 [237] into the inlet for the Air Cleaner Ass'y [222] of the Carburetor Ass'y [202].

8-4-10. Checking and adjustment of the carburetor ass'y

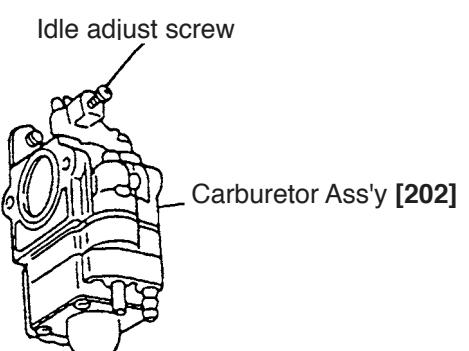

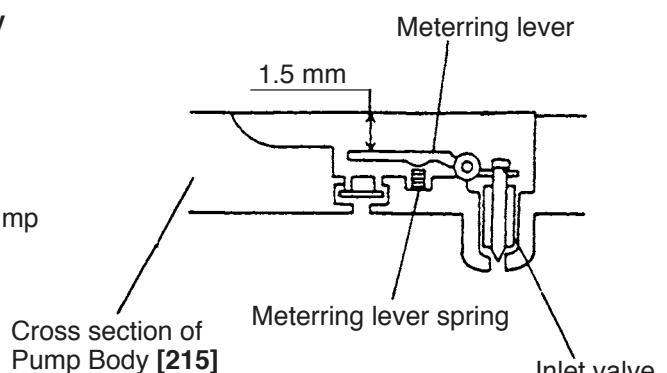

A. Checking the carburetor ass'y

(1) Check the following parts when disassembling the Carburetor Ass'y [202].

- Deformation of the mettering lever spring of the Pump Body [215]
- Wear of the inlet valve of the Pump Body [215]
- Hardening or damage to the Diaphragm [214]
- Hardening or damage to the Diaphragm [217]
- Clogging of the Jet Main [212]

(2) If the fuel overflows, the tip of the inlet valve is worn or clogged with dust. Disassemble the Carburetor Ass'y [202] and check it. Clean the inlet or replace with new one.

(3) The standard height of the mettering lever is 1.5 mm higher than the end surface of the main body.

B. Adjustment of the carburetor ass'y

(1) Idle adjust screw

Adjust opening of the throttle valve during idling. The engine speed increases by turning clockwise and decreases by turning counterclockwise. When the blade rotates during idling, decrease the speed so that the blade does not rotate. Note that too low speed may stop the engine during idling. In such a case, increase the speed but do not allow the blade to rotate.

(2) The standard setting value of the Carburetor Ass'y [202] is as follows.

Idle adjust screw	* 2,700 to 3,300 min ⁻¹ (Check that the blade does not rotate.)
-------------------	---

* For the speed other than the Models CG 32EA and CG 32EA (SL), refer to the idling rotation speed listed in the table of 8-2.

(3) It is impossible to adjust both the idle needle that adjusts the flow rate of fuel at low speed and the high speed needle that adjusts the flow rate of fuel at high speed.

8-5. Disassembly and Reassembly

8-5-1. Disassembly of the engine

(1) Disconnect the three internal wires of the Throttle Trigger [14] (29) from the engine. Loosen the Bolt (W/Sp. Washer) M5 x 25 [11] and four Bolts (W/Washers) M5 x 20 [10] and separate the engine from the drive shaft tube.

(2) Removal of the top cover and the starter ass'y

Loosen the Knob [117] and remove the Top Cover [118]. Loosen the four Cap Screws M4 x 16 [177] and remove the Recoil Ass'y [170].

(3) Removal of the fan cover

Loosen the four Cap Screws M5 x 20 [163]. Remove the Clamp [164], one internal wire of the Throttle Trigger [14] (29) and Fan Cover [162].

(4) Removal of the fuel tank

Pull out the Fuel Pipe [235] and the Return Pipe [237] from the Carburetor Ass'y [202]. Remove the Fan Cover [162] or the Recoil Starter Ass'y [165] then remove the Fuel Tank [241].

(5) Removal of the carburetor ass'y and the muffler

Remove the Air Cleaner Cover [229] and the Element [228]. Loosen the two Cap Screws M5 x 60 [230] then remove the Housing [224] and the Carburetor Ass'y [202]. Loosen the Knob [117] and remove the Top Cover [118]. Loosen the two Cap Screws M5 x 55 [113] and remove the Muffler Comp. [114].

(6) Removal of the coil and the plug cap

Loosen the Knob [117] and remove the Top Cover [118]. Loosen the two Cap Screws M4 x 25 [142] and remove the Coil [141]. Apply a drop of oil into the hole for the spark plug on the Plug Cap [137] and spread the applied oil entirely by inserting and pulling the high tension cable. Slowly disconnect the Connector [136] being careful not to stretch it.

(7) Removal of the clutch ass'y and the starter pulley

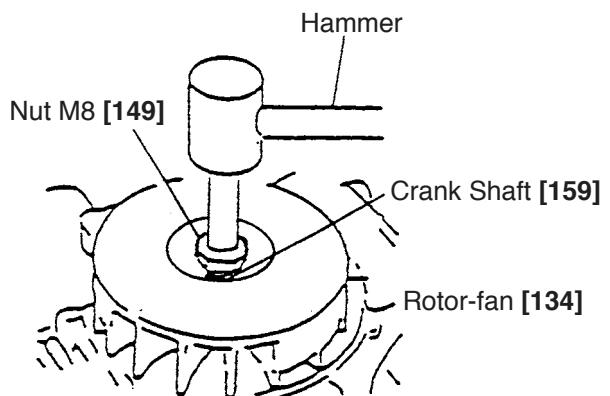

To stop turning the crank shaft, insert the rope of the Recoil Starter Ass'y [165] into the spark plug mounting hole of the Cylinder [126] and turn the Rotor-fan [134] counterclockwise to lock the Piston [129] at the top dead center. Loosen the two Special Bolts M6 [144] and remove the Clutch Ass'y [146]. With the crank shaft stopped, tap the Starter Pulley Ass'y [166] lightly with a plastic hammer so that it turns counterclockwise. Then the Starter Pulley Ass'y [166] can be removed.

NOTE: Use a clean rope to stop turning the crank shaft. Do not leave foreign matter such as shreds of rope in the cylinder.

(8) Removal of the rotor-fan

Stop turning the Crank Shaft [159] in the same manner as the above (7) and loosen the Nut M8 [149]. Make the screw end surface of the Crank Shaft [159] flush with the top surface of the Nut M8 [149]. Holding the Rotor-fan [134] with a hand, tap the end surface of the Crank Shaft [159] lightly with a hammer. Then the Rotor-fan [134] can be removed.

Holding the Rotor-fan [134] with a hand, tap the end surface of the Crank Shaft [159] lightly with a hammer. Be careful not to deform the threaded portion.

(9) Removal of the cylinder

Loosen the four Cap Screws M5 x 20 [125] and pull out the Cylinder [126] slowly.

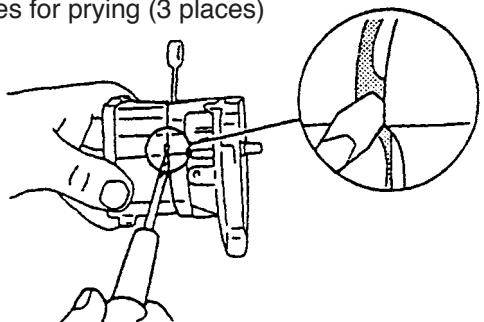

(10) Removal of the piston and the piston ring

Remove the Clip (Piston Pin) [130] with a pair of long-nose pliers. Tap the Piston Pin [131] lightly and remove the Piston [129]. Pull out the Piston Ring [128] by opening up the juncture of the ring. Be careful not to open up the juncture forcedly. Otherwise, the cast-iron ring may be broken.

(11) Removal of the crank case

Grooves have been cast into the Crank Case [152] at the screw attaching points to provide a means for separating the two Crank Case [152] halves. Insert a screwdriver into the grooves and gently pry the two halves apart. The Crank Shaft [159] is a snug slip-fit in the two Bearings 201C3 [154]. the Crank Case [152] halves should be carefully separated from the Crank Shaft [159].

Grooves for prying (3 places)

NOTE: The Crank Shaft [159] and the connecting rod are assembled as one complete unit and cannot be separated.

8-5-2. Reassembly of the engine

(1) Removal of carbon

Before reassembly of the engine, clean carbon off the piston head, exhaust port of the cylinder and combustion chamber. If the piston ring fitted in the piston groove does not move smoothly, clean carbon off the ring groove and the side of the piston ring completely. Be careful not to scratch the parts such as cylinder and piston. Clean carbon off the air inlet and the exhaust port of the muffler, too.

(2) Cleaning the parts

Clean the Crank Case [152], Crank Shaft [159], Piston [129], Piston Ring [128], Piston Pin [131] and Cylinder [126] with gasoline.

(3) Reassembly of the crank case, piston and cylinder

Press-fit Oil Seals (B) and (C) [160] [151] in the Crank Case [152] so that the pressure spring is positioned inwardly. Apply "Multemp PS No. 2 (Kyodo Yushi Co., Ltd.)" between the lips. Do not reuse the removed oil seals. Be sure to replace them with new ones.

Be sure the mating surfaces of the crank case halves are clean and dry. Apply a small continuous bead of liquid gasket to the mating surface of only one of the crank case halves. Using care to prevent damage to the seal, place the rotor-half of the crank case onto the crank shaft and press squarely until the crank case halves come together.

Use the following liquid gasket.

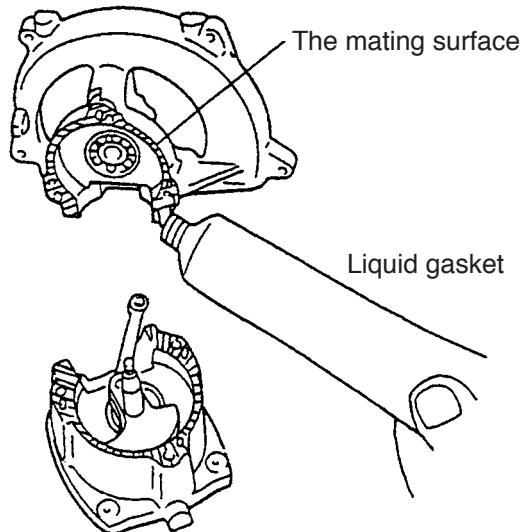

Maker: Threebond

Type: Nonsolvent type siliconebased

Name of product: Threebond 1207D

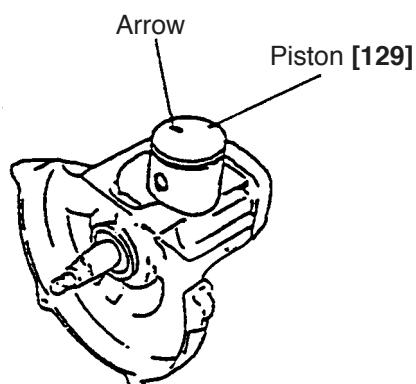

Before reassembly of the cylinder, apply two-cycle oil to the ball bearings, connecting rod large/small end bearings, piston ring and inside of the cylinder with two-cycle oil.

Mount the Piston [129] to the connecting rod facing the exhaust (arrow) mark at the top of the piston to the muffler. When mounting the Cylinder [126], correctly align the juncture of the Piston Ring [128] with the stopper pin of the piston groove, and align the position of the cylinder with the piston. Otherwise, the Piston Ring [128] may be broken.

(4) Mounting the rotor-fan and the clutch ass'y

Mount the Woodruff Key [155] to the key way of the Crank Shaft [159]. Align the Woodruff Key [155] with the key way of the center hole of the Rotor-fan [134] and tighten the Nut M8 [149]. To reassemble the Clutch Ass'y [146], mount the Clutch Shoe [148] to the Spring Clutch [147] being careful of the arrow mark direction on the Clutch Shoe [148] (counterclockwise viewing from the drive shaft tube). Put the Washer [150] between the Clutch Shoe [148] and the Rotor-fan [134] and insert the Special Bolts M6 [144] into the Wave Washers [145]. Tighten the two Special Bolts M6 [144].

(5) Mounting the carburetor ass'y

Mount the Carburetor Ass'y [202] aligning the pulse holes of the Insulator [123] and the Air Duct [122] with the pulse holes of the Cylinder [126] and the Carburetor Ass'y [202].

8-5-3. Removal of the drive shaft tube

- (1) Loosen the Bolt (W/Sp. Washer) M5 x 25 [82] and the Bolt M5 x 12 [71]. Remove the Gear Case Ass'y [72] from the Drive Shaft Tube [31] by tapping the Gear Case Ass'y [72] lightly.
- (2) Disassemble the Gear Case Ass'y [72] as follows.
 - When the 4-teeth blade is mounted:
Remove the Bolt (Left Hand) W/Washers M8 x 22 [73], Stabilizer [74], Cutter Blade 255MM-D25.4 Hole-NT4 [502], Clamping Washer [75], Boss Adapter [76] and Safety Guard Ass'y [35].
 - When the semi-automatic head 4" is mounted:
Remove the Semi-automatic Head 4" [503], Clamping Washer [75], Boss Adapter [76] and Safety Guard Ass'y [35]. Warm up the Gear Case Ass'y [72]. Remove the Snap Ring H9 [86] and Snap Ring H24 [87] from the pinion of the Gear Set [88]. Remove the pinion by tapping the Gear Case Ass'y [72] lightly. At the same time, remove the Snap Ring H28 [77] then tapping the Gear Case Ass'y [72] lightly, remove the Blade Shaft [79] and the gear from the Gear Set [88].
- (3) Pull out the Drive Shaft [30] from the Drive Shaft Tube [31].
- (4) Disassembly of the clutch drum and the clutch case ass'y
Secure the Drive Shaft [30] by two surfaces at the tip of the cutter blade side and loosen the Clutch Drum [12]. Warm up the Clutch Case Ass'y [2] and loosen the four Screws (W/Sp. Washer) M5 x 15 [9]. Tap the Bearing Case [8] with a wooden hammer toward the engine to remove the Drive Shaft Tube Adapter [5]. Remove the Snap Ring H26 [4]. Tap the Bearing Case [8] with a wooden hammer to remove the two Bearings 6000ZZ [3].

8-5-4. Reassembly of the drive shaft tube

- (1) Mounting the clutch drum
Mount the Snap Ring H26 [4] to the Bearing Case [8]. Then secure the Drive Shaft [30] by two surfaces at the tip of the cutter blade side and mount the Clutch Drum [12].
- (2) Mounting the drive shaft
Wipe the stained grease off the Drive Shaft [30] and apply "Doubrex 251" grease lightly. Insert it into the Drive Shaft Tube [31].
- (3) Mounting the blade shaft
Insert the Blade Shaft [79] into the gear of the Gear Set [88]. Press-fit the Bearing 60012RK [78] and the Bearing 608 [80] then press-fit it to the Gear Case [83] and secure with the Snap Ring H28 [77]. At this time, be careful not to deform the Snap Ring H28 [77] excessively and check that the Snap Ring H28 [77] is securely fit in the groove of the Gear Case [83].

(4) Mounting the pinion

Press-fit the Bearing 609 [84] and the Bearing 609Z [85] to the pinion of the Gear Set [88] and secure with the Snap Ring H9 [86]. Press-fit the pinion to the inmost position of the gear case hole and secure with the Snap Ring H24 [87]. At this time, be careful not to scratch the pinion by contacting the gear teeth. After mounting the Blade Shaft [79] and the pinion to the Gear Case [83], remove the Bolt M8 x 10 (Black) [81] from the Gear Case [83] and fill grease (Service Code No. 682975) in the Gear Case [83] through the screw hole.

(5) Mounting the gear case

Insert the Drive Shaft Tube [31] into the hole of the Gear Case [83] as far as it will go aligning the side hole of the Drive Shaft Tube [31] with the M5 screw hole at the side of the Gear Case [83]. Tighten the Bolt M5 x 12 [71] securely being careful not to contact the Drive Shaft Tube [31]. Tighten the Bolt (W/Sp. Washer) M5 x 25 [82]. Check that the Drive Shaft [30] is inserted into the pinion completely. It is inserted completely when the Blade Shaft [79] rotates by rotating the Drive Shaft [30] coming out of the engine side end of the Drive Shaft Tube [31].

8-5-5. Mounting the handle

[Model CG 32EA]

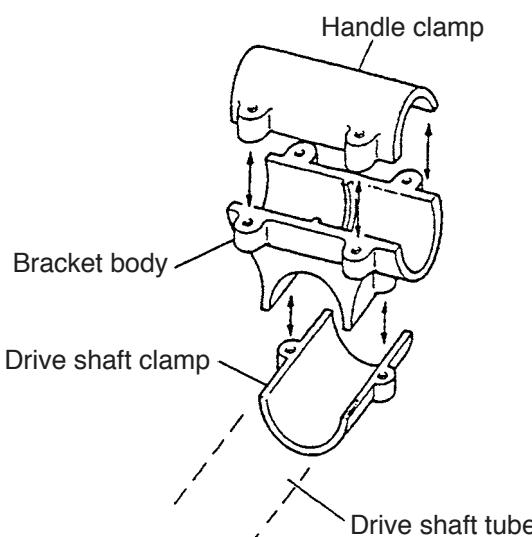

Position the bracket body and the drive shaft clamp of the Handle Bracket Ass'y [16] closer to the gear case than the Hanging Bracket Ass'y [21]. Tighten the two Bolts (W/Sp. Washer) M5 x 25 [17] evenly. Align Handle (A) Ass'y [18] and Handle (B) Ass'y [13] with the groove at the center of the bracket body. Place the handle clamp on it and tighten the four Bolts (W/Sp. Washer) M5 x 25 [17] evenly to secure it.

[Model CG 32EA (SL)]

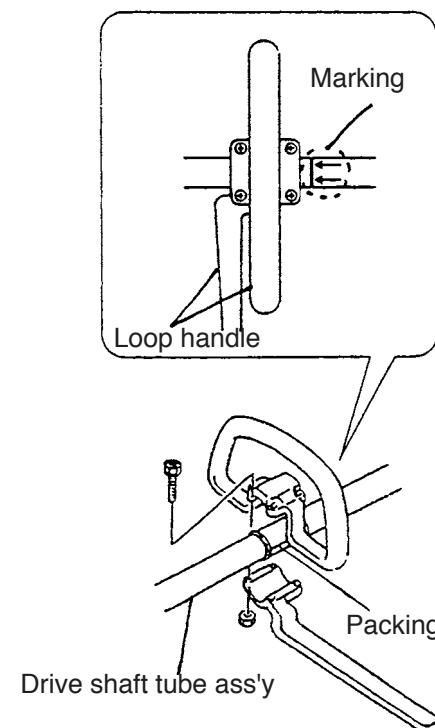

Position Packing (A) (27) closer to the gear case than the marked line on the Drive Shaft Tube (31). Place the Loop Handle (26) on it and tighten the four Screws (W/Sp. Washer) M5 x 28 (25) evenly to secure it.

[CG 32EA]

Horn handle bracket assembly

8-8. Confirmation After Reassembly

- Confirm that all fastening screws, bolts and nuts are properly tightened.
- Confirm that each moving part functions properly, and that there is no abnormal noise from rotating parts.
- Confirm that there is no gas leakage from any part of the engine section.
- Confirm that the stop switch functions properly.
