7. ORBITAL MECHANISM

7-1. Blade Movement

In the Models CJ 120V and CJ 120VA, the orbital mechanism moves the blade up-and-down and forward-and-backward in the same manner as the Models CJ 110V and 110 VA. This makes the blade dig well into wood and other soft materials and also discharges cutting chips well to achieve speedy cutting. The amount of fore-and-aft blade movement can be adjusted just by turning the change knob to any of the four settings. The following table shows the modeled orbits of blade movement at each orbital position (change knob position).

	III	II	I	0
Orbital position				
Blade edge movement	 26 mm (1") 2.3 mm (3/32") (At guide roller position)	 1.4 mm (1/16")	 0.5 mm (1/48")	 Perpendicular movement only

Table 1 Blade movement illustration

7-2. Orbital Position Selection

Selection of the most appropriate orbital position for each cutting job is essential to achieve the best efficiency for cutting. However, as the best orbital position depends on such factors as the hardness and thickness of the workpiece, the desired finish of the cut surface, and so on, it is not practical to set a single, simple standard for best orbital position selection. Table 2 can be used as a general guide for appropriate orbital position selection based on various factors.

Table 2 General guide for appropriate orbital position selection

Factor	Orbital position			
	III	II	I	0
Material hardness	Soft material	←	→	Hard material
Material thickness	Thick	←	→	Thin
Cutting speed	Faster cutting	←	→	Slower cutting
Straight cutting or curved cutting	Straight cutting	←	→	Curved cutting
Surface finishing	Rough finish acceptable (splintering, chipping acceptable)	←	→	Fine finishing
Material stability	Unstable	←	→	Very stable

8. BLADES

Proper blade selection is very important to obtain the maximum performance of this model. The table below, based on type and thickness of the material to be cut, can be used as a handy reference in selecting the optimum blade.

CAUTION

- **Ensure without fail that the insulation resistance measurement and dielectric strength test are conducted between the plug blade and some portion of the external metal frame such as the gear cover with main switch turned ON. Never carry out these tests between the two blades of the plug. This could cause burning out of the control element in the switch.**

10-5. No-Load Current Value

After no-load operation for 30 minutes, the no-load current value should be as specified below at a frequency of 50/60 Hz.

Voltage (V)	110	120	230	240
Current (A) Max.	2.8	3.0	1.4	1.3
