## 1. PRODUCT NAME

Hitachi Generator, Models E 43, E 60 and E 71

## 2. MARKETING OBJECTIVE

A series of generators, Models E 43, E 60 and E 71 will be put on the North American market in order to introduce our new engine tools on overseas markets. The maximum output of these generators is shown in the following table.

Model	Max. output
E 43	4300 VA
E 60	6000 VA
E 71	7100 VA

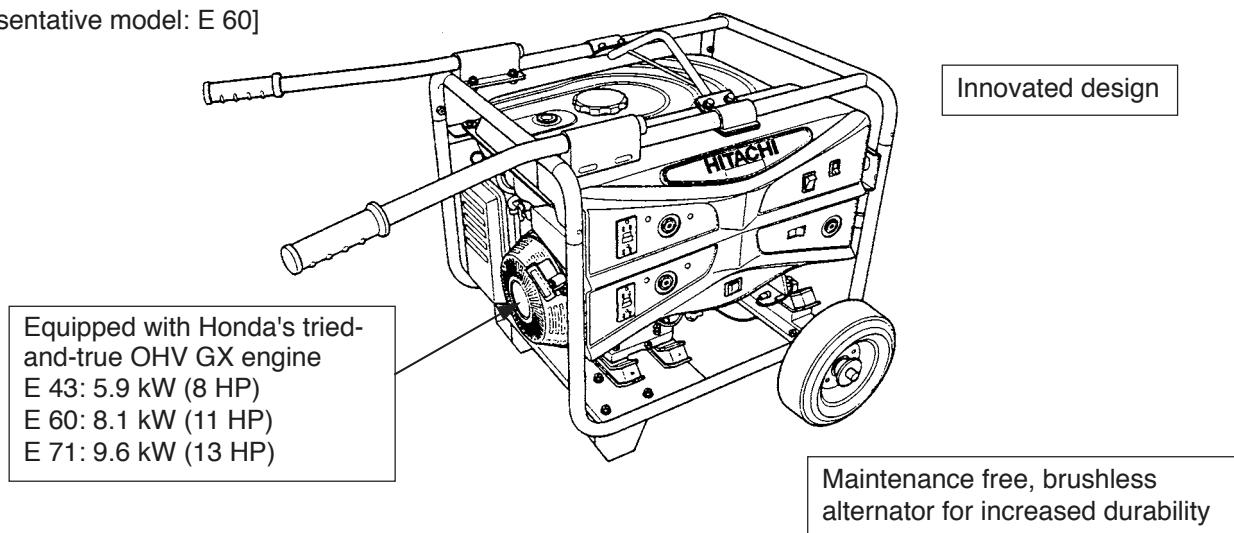

All of these Models E 43, E 60 and E 71 comply with EPA (U.S. Environmental Protection Agency) and CARB (the California Air Resources Board) emissions regulations. Please promote the sales of these Models E 43, E 60 and E 71.

## 3. APPLICATIONS

Power source of electric appliances and tools

## 4. SELLING POINTS

[Representative model: E 60]

### 4-1. Selling Points Descriptions

#### (1) Innovated design

Each of the Models E 43, E 60 and E 71 is of a powerful and innovated design.

#### (2) Equipped with Honda's tried-and-true OHV GX engine

Each of the Models E 43, E 60 and E 71 is equipped with Honda's tried-and-true OHV GX engine that is well reputed in the North American market.

Model E 43: The maximum output of the engine is 5.9 kW (8 HP)/3600 min<sup>-1</sup>.

Model E 60: The maximum output of the engine is 8.1 kW (11 HP)/3600 min<sup>-1</sup>.

Model E 71: The maximum output of the engine is 9.6 kW (13 HP)/3600 min<sup>-1</sup>.

#### (3) Maintenance free, brushless alternator for increased durability

## 5. SPECIFICATIONS

Model		E43	E 60	E 71	
Generator					
Rated AC voltage	V		120/240		
Rated AC current	Amp	31.7/15.9	41.7/20.8	50.0/25.0	
Rated AC output	VA	3800	5000	6000	
Max. output	VA	4300	6000	7100	
Phase		Single			
Frequency	Hz		60		
Engine					
Model		GX240	GX340	GX390	
Max. output	bhp (kW)/3600r/min.	8 (5.9)	11 (8.1)	13 (9.6)	
Fuel tank capacity	Gallons (Liters)		5 (18.9)		
Recommended fuel		Unleaded gasoline(86 octane or higher)			
Oil capacity	Quarts (Liters)		1.16 (1.1)		
Recommended oil		SAE 10W-30 API SJ or SL			
Spark plug		BPR6ES (NGK) or W20EPR-U (DENSO)			
General					
Starting system		Recoil			
Oil alert system		Provided			
Auto idle system		Provided			
Dimensions [Including accessory]	in. (mm) L x W x H	42.3 x 29.4 x 29.0 (1075 x 746 x 737) 26.0 x 21.7 x 20.7 (660 x 550 x 525)			
Dry weight [Including accessory]	lb (kg)	157 (71) (198 (90))	181 (82) (223 (101))	201 (91) (243 (110))	

## 6. CAPACITY OF GENERATOR

### 6-1. Selection of Proper Generator

Select the proper generator as follows according to the power consumption, output and the like of the AC electrical equipment to be used.

(1) When the power consumption of the electrical equipment is known

When the power consumption of the electrical equipment is known, calculate the necessary output of the generator (VA) according to the formula shown in the table below. When the sum of the calculated "necessary output of the generator (VA)" is equal to or less than the rated AC output of the generator, the generator can be used continuously.

Electrical equipment	Power factor	Necessary output of the generator (VA)
Bulbs, electric heaters, etc.	1.0	$\frac{\text{Power consumption of the electrical equipment (W)}}{\text{Power factor}}$
Electric power tools (Commutator motors)	0.8 to 0.95	
General-purpose motors (Induction motors)	0.4 to 0.75	

Because a general electrical equipment is not indicated with the power factor, "0.8" is used in the case of an electric power tool and "0.5" in the case of a general-purpose motor for the above rough calculation.

Generator	Rated AC output
E 43	3800 VA
E 60	5000 VA
E 71	6000 VA

Power consumption of an electric circular saw, planer, disk grinder or the like may be higher depending on the load. In order to deliver the full performance, it is necessary to estimate 1.5 to 2 times greater power consumption.

## (2) When the motor output of the electrical equipment is known

Some electrical equipment is not indicated with the current and the power consumption but the motor output. In such cases, the generator can be used when the sum of the "necessary output of the generator (VA)" obtained from the following formula is less than the rated AC output of the generator (VA).

$$\text{Necessary output of the generator (VA)} = \frac{\text{Motor output of the electrical equipment (W)}}{\text{Efficiency} \times \text{Power factor}}$$

Generally, the following values are used though efficiency varies depending on the types of motors.

Electrical equipment	Power factor
Electric power tools (Commutator motors)	0.6
General-purpose motors (Induction motors)	0.9

## 6-2. Starting Current

The current required from starting the above electrical equipment to operating in steady state is larger than the current or the power required during "operation" of the electrical equipment. This is called "starting current".

There is no problem if no load is applied to an electric power tool equipped with a commutator motor from the start. However, there may be a case that an electric power tool equipped with an induction motor (especially the starting current of a split-phase induction motor is about three times larger than the current during operation) cannot be started.

## 7. PRECAUTIONS IN SALES PROMOTION

In the interest of promoting the safest and most efficient use of the Models E 43, E 60 and E 71 Generators by all of our customers, it is very important that at the time of sale the salesperson carefully ensures that the buyer seriously recognizes the importance of the contents of the Handling Instructions, and fully understands the meaning of the precautions listed on the Caution Plates attached to each unit.

### 7-1. Handling Instructions

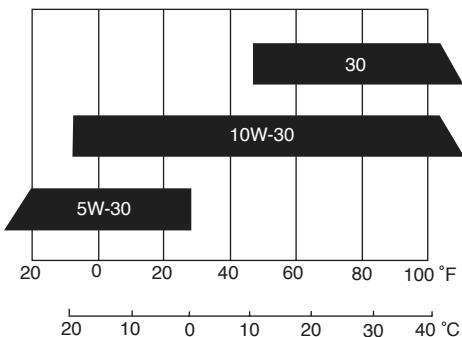

Although every effort is made in each step of design, manufacture and inspection to provide protection against safety hazards, the dangers inherent in the use of any generator cannot be completely eliminated. Accordingly, specific precautions and suggestions for the use of the generator are listed in the Handling Instructions to enhance the safe and efficient use of the tool by the customer. Salesperson must be thoroughly familiar with the contents of the Handling Instructions to be able to offer appropriate guidance to the customer during sales promotion.

### 7-2. Thorough Instruction to the Customers

(1) HITACHI electronic controlled products should not be used with portable generators.

Irregular generator power could cause these products to fail. Regarding other manufacturer's products, please contact the manufacturer to see if it is safe to use the electronic controlled products with portable generators.

(2) There is no oil in the engine crankcase when the generator is shipped. You must add oil before starting the engine. Check the oil level before each use with the generator on a level surface and the engine stopped. Engine oil is a major factor affecting engine performance and service life. Non-detergent and 2-stroke oils will damage the engine and are not recommended. Use 4-stroke motor oil that meets or exceeds the requirements for API service classification SJ or SL. Always check the API SERVICE label on the oil container to be sure it includes the letters SJ or SL. SAE 10W-30 is recommended for general, all-temperature use. Other viscosities shown in the right graph may be used when the average temperature in your area is within the indicated range.

(3) Each generator has AC receptacles as shown in the table below.

Output plug	Voltage	Current	E 43	E 60	E 71
GFCI (Ground-fault circuit interrupter) Duplex receptacles	120 V	20 A	2	2	2
Twist-locking receptacles	120 V	30 A	1	2	2
	120/240 V	20 A	1	None	None
	120/240 V	30 A	None	1	1

Note that each of the above current values means the maximum current for one receptacle.

- (4) When using an extension cord between the generator and an electrical equipment, it is necessary to observe the specifications about the cord thickness (nominal cross sectional area of the core) and the length indicated on the electrical equipment. If a long and thin extension cord is used, the voltage will be reduced remarkably and the electrical equipment will be overheated or put out of action. To minimize voltage reduction, it is necessary to use a short extension cord whose core is as thick as possible.
- (5) Before operation, perform inspection according to the Handling Instructions.

## **8. MAINTENANCE**

Periodical maintenance is required for efficient use of the Models E 43, E 60 and E 71 by the customers. Advise the customers to thoroughly read and understand the maintenance instructions specified in the Handling Instructions ("MAINTENANCE").

## 9. TROUBLESHOOTING GUIDE

### 9-1. Diagnosis and Corrective Action

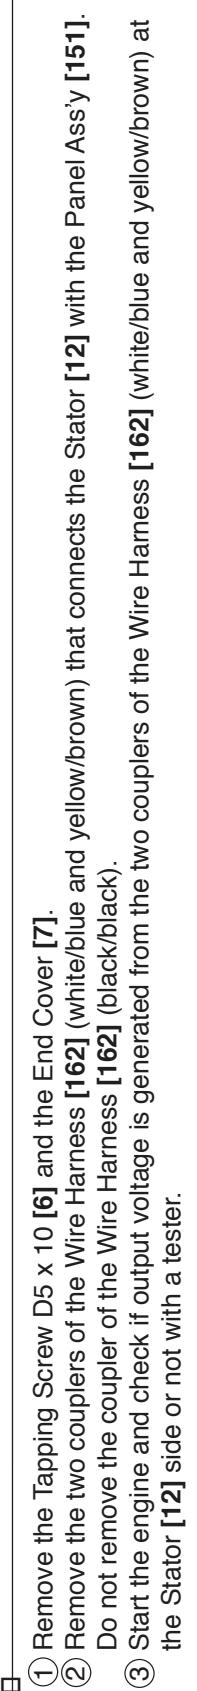

- Reinstall each part after the proper corrective action.
- Stop the engine first then replace or check the parts.
- Contact Honda Service Center for any trouble or repair of the engine.

Trouble	Cause	Corrective action	Procedure
The engine does not start.	There is no fuel. Air is mixed in fuel.	Replenish with fuel. Deaerate fuel.	① Open the fuel cock. ② Remove the drain bolt from the carburetor and drain fuel into a container for deaeration.
The strainer is clogged.	Disassemble the strainer and clean the components.		① Open the cup at the bottom of the strainer. ② Clean the filter.
The air cleaner is clogged.	Clean the air cleaner element.		① Remove the air cleaner cover. ② Clean the element with oil or the like and dry it. ③ Soak the element in the engine oil and wring oil well from the element.
The engine oil is highly viscous.	Check and change the engine oil.		① Remove the drain bolt. ② Drain the engine oil. ③ Pour proper-viscosity engine oil.
The ignition plug is loose.	Tighten the ignition plug.		① Remove the plug cap. ② Tighten the ignition plug with the exclusive plug wrench.
The electrodes of the ignition plug are faulty.	Clean the ignition plug. Adjust the clearance between the electrodes and replace the ignition plug if abnormal.□		① Remove the ignition plug. ② Clean the electrodes with a wire brush or the like. ③ Check that the clearance between the electrodes is within the range from 0.028 to 0.031 inch (from 0.7 to 0.8 mm). Replace the ignition plug if there is any abnormality.
The carburetor is clogged.	Contact Honda Service Center.		—
The throttle valve is closed due to improper adjustment of the governor.	Contact Honda Service Center.		—
The oil level sensor is operated.	A) Replenish with the engine oil if short.  B) Check and replace the oil level sensor. ... Contact Honda Service Center.		① Remove the oil cap. ② Add a proper amount of engine oil.
The engine starts but stops soon.	The oil level sensor is operated.	A) Replenish with the engine oil if short.	① Remove the oil cap. ② Add a proper amount of engine oil.

Trouble	Cause	Corrective action	Procedure
The engine starts but stops soon.	The oil level sensor is operated.	B) Check and replace the oil level sensor. ... Contact Honda Service Center.	—
The number of revolutions does not increase. Rated number of revolutions of the engine (no-load) : 3,400 to 3,800 r/min (reference)	Air is mixed in fuel.  The strainer is clogged.  The air cleaner is clogged.  The governor is adjusted improperly.  The carburetor is faulty.  Too much load is applied.	Dearate fuel.  Disassemble the strainer and clean the components.  Clean the air cleaner element.  Contact Honda Service Center.  Contact Honda Service Center.  Check the connected electrical equipment.	<p>① Open the fuel cock. ② Remove the drain bolt from the carburetor and drain fuel into a container for deaeration.</p> <p>① Open the cup at the bottom of the strainer. ② Clean the filter.</p> <p>① Remove the air cleaner cover. ② Clean the element with oil or the like and dry it. ③ Soak the element in the engine oil and wring oil well from the element.</p> <p>—</p> <p>—</p> <p>—</p>
The number of revolutions is abnormal. (increase/decrease/large variation) Rated number of revolutions of the engine (no-load) : 3,400 to 3,800 r/min (reference)	Load varies greatly.	Check the operating conditions of the connected electrical equipment.	<p>—</p> <p>—</p> <p>—</p>
No voltage is generated from the power receptacle.	The Breaker [124] is turned off.  The Thermal Protectors [117] [119] are turned off.	Check the Breaker [124].  Check the Thermal Protectors [117] [119].	<p>① Disconnect the plug. ② Turn on the Breaker [124].</p> <p>① Disconnect the plug. ② Leave the Thermal Protectors [117] [119] for a while to cool them. ③ Press the button.</p>

Trouble	Cause	Corrective action	Procedure
No voltage is generated from the power receptacle.	The Power Receptacle (GFCI) [115] is operated.	Check the GFCI.	<p>① Disconnect the plug.          ② Press the reset button of the Power Receptacle (GFCI) [115].          ③ Check if there is any abnormality (leakage) in the connected electrical equipment. If there is abnormality, do not use the electrical equipment.</p>
The voltage 240 V is not outputted.	Turn the Select Switch [125] to "240 V".	Turn the Select Switch [125] to "240 V".  ① Disconnect all the plugs from the Power Receptacles [115] [118] [127]. ② Turn off the Breaker [124]. ③ Turn the Select Switch [125] to "240 V".	

If the trouble is caused by any cause other than the above, diagnose and take the necessary measures according to the following flow chart.

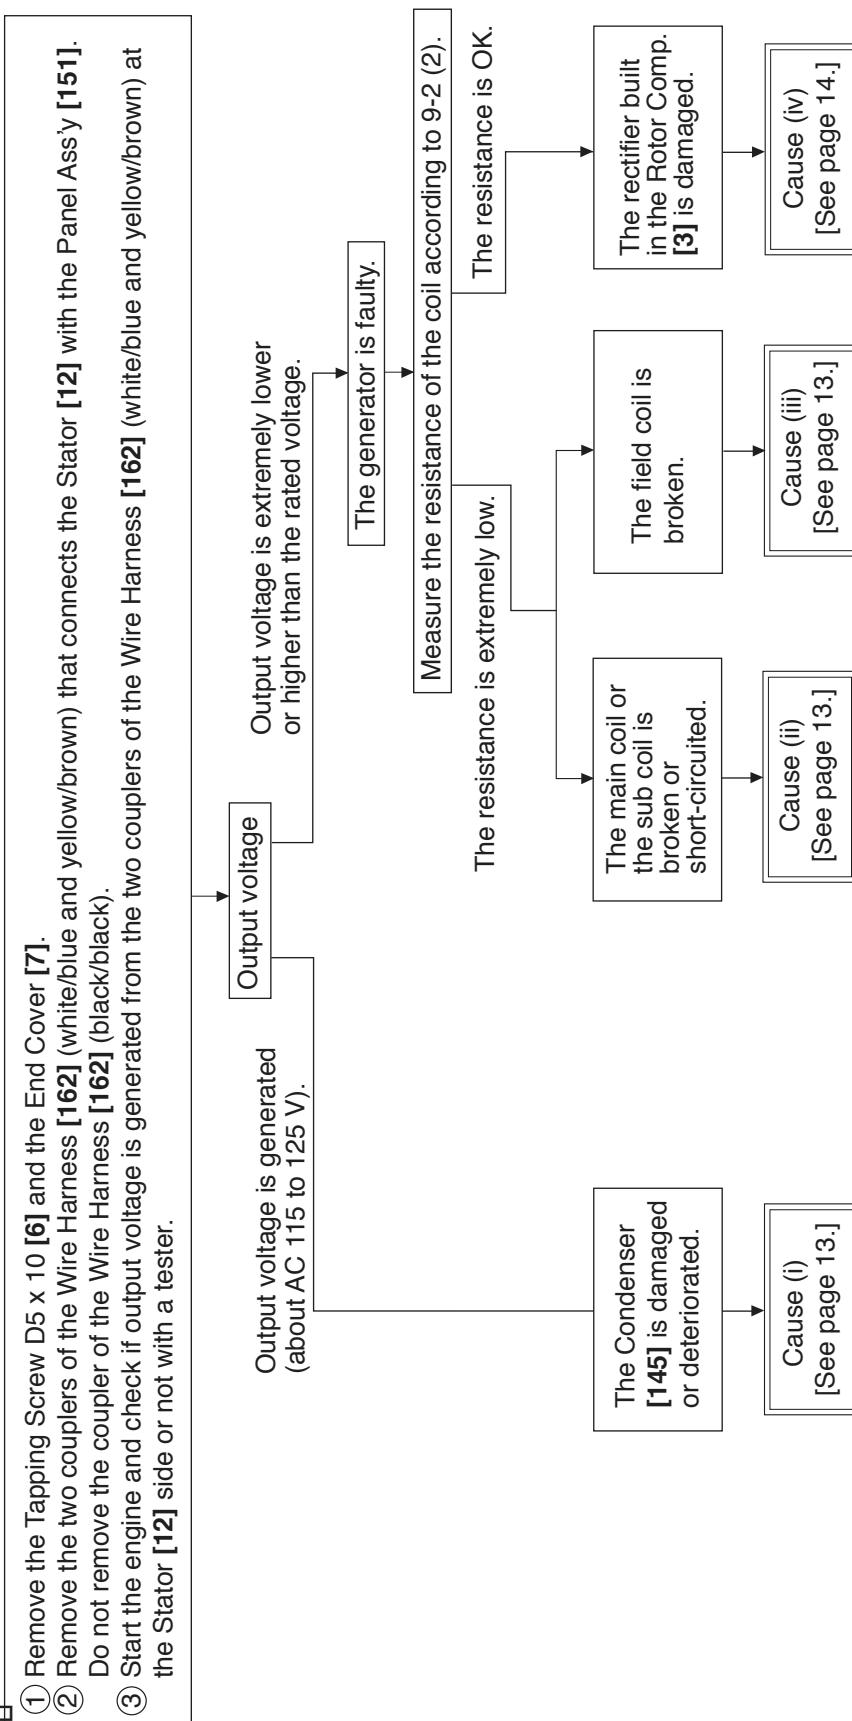

Cause	Corrective action	Procedure
(i) The Condenser [145] is damaged or deteriorated.	Replace the Condenser [145].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M6 x 24 [77] from the side of the Panel Ass'y [151].</p> <p>③ Pull the Panel Ass'y [151] and remove the couplers of the Wire Harness [94] and the Wire Harness [161] from the Engine [71] behind the Box Ass'y [141].</p> <p>④ Push the Wire Harness [162] in the Box Ass'y [141].</p> <p>⑤ Remove the Hex. Bolt M6 x 12 [147] and open the Box Ass'y [141] a little.</p> <p>⑥ Push the claw of the coupler (above step ③) fitted in the Box Ass'y [141] to remove it from the Box Ass'y [141].</p> <p>⑦ Open the Box Ass'y [141] and remove the Condenser [145] from the Wire Harness [162].</p> <p>⑧ Replace the Condenser [145] fitted in the Box Ass'y [141].</p>
(ii) The Breaker [124] is faulty (Breaker [124] and Thermal Protectors [117] [119]).	Replace the Breaker [124] and the Thermal Protectors [117] [119].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M6 x 24 [77] from the side of the Panel Ass'y [151].</p> <p>③ Pull the Panel Ass'y [151] and remove the couplers of the Wire Harness [94] and the Wire Harness [161] from the Engine [71] behind the Box Ass'y [141].</p> <p>④ Push the Wire Harness [162] in the Box Ass'y [141].</p> <p>⑤ Remove the Hex. Bolt M6 x 12 [147] and open the Box Ass'y [141] a little.</p> <p>⑥ Push the claws of the couplers (above step ③) fitted in the Box Ass'y [141] to remove the couplers from the Box Ass'y [141].</p> <p>⑦ Remove the Grommet [144] and put the couplers (above step ⑥) in the Box Ass'y [141].</p> <p>⑧ Open the Box Ass'y [141] and remove the Condenser [145] from the Wire Harness [162].</p> <p>⑨ Pull out the Wire Harness [162] from the Box Ass'y [141] and remove the Box Ass'y [141].</p> <p><u>Removal of the Breaker [124]</u></p> <p>⑩ Remove the Hex. Nut [116] from the Breaker [124].</p> <p>⑪ Disconnect the terminal and replace the Breaker [124].</p> <p><u>Removal of the Thermal Protector [117] for GFCI</u></p> <p>⑫ Disconnect the faston terminal.</p> <p>⑬ Release the claw locked in the Panel (1) [114] surface and replace the Thermal Protector [117].</p> <p><u>Removal of the Thermal Protector [119] for twist-lock receptacles</u></p> <p>⑭ Disconnect the round terminal (screw).</p> <p>⑮ Release the claw locked in the Panel (1) [114] surface and replace the Thermal Protector [119].</p>

Cause	Corrective action	Procedure
(iii) The internal wiring of the Panel Ass'y [151] is short-circuited or broken. □	Repair or replace the Panel Comp. [111], Cord Comp. <Model E 43: [163] to [171]> <Models E 60 and E 71: [163] to [172]>, and Wire Harness [162].	<p>Perform the above steps from ① to ⑩.</p> <p>① Disconnect the terminals related to the faulty Cord Comp. &lt; Model E 43: [163] to [171]&gt; &lt;Models E 60 and E 71: [163] to [172]&gt; and Wire Harness [162].</p> <p>② Replace the Cord Comp. &lt; Model E 43: [163] to [171]&gt; &lt; Models E 60 and E 71: [163] to [172]&gt; and Wire Harness [162].</p>
(iv) The main coil or the sub coil is broken or short-circuited.	Replace the Stator [12].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p>
(v) The field coil is broken.	Replace the Rotor Comp. [3].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p> <p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>⑩ Replace the Rotor Comp. [3].</p> <p>□</p> <p><b>CAUTION:</b> Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</p>

Cause	Corrective action	Procedure
(vi) The rectifier built in the Rotor Comp. [3] is damaged.	Replace the Rotor Comp. [3].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p> <p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>□</p> <p>⑩ Replace the Rotor Comp. [3].</p> <p><b>CAUTION:</b> Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</p>

Trouble	Cause	Corrective action	Procedure
It does not reach the rated voltage.	The number of revolutions of the Engine [7] is low. Rated number of revolutions of the engine (no-load): 3,400 to 3,800 r/min (reference)	A) Check the connected electrical equipment. B) Contact Honda Service Center.	—

If the trouble is caused by any cause other than the above, diagnose and take the necessary measures according to the following flow chart.

Cause	Corrective action	Procedure
(i) The Condenser [145] is damaged or deteriorated.	Replace the Condenser [145].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M6 x 24 [77] from the side of the Panel Assy [151].</p> <p>③ Pull the Panel Assy [151] and remove the couplers of the Wire Harness [94] and the Wire Harness [161] from the Engine [71] behind the Box Assy [141].</p> <p>④ Push the Wire Harness [162] in the Box Assy [141].</p> <p>⑤ Remove the Hex. Bolt M6 x 12 [147] and open the Box Assy [141] a little.</p> <p>⑥ Push the claws of the couplers (above step ③ ) fitted in the Box Assy [141] to remove it from the Box Assy [141].</p> <p>⑦ Open the Box Assy [141] and remove the Condenser [145] from the Wire Harness [162].</p> <p>⑧ Replace the Condenser [145] fitted in the Box Assy [141].</p>
(ii) The main coil or the sub coil is broken or short-circuited.	Replace the Stator [12].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p>
(iii) The field coil is broken.	Replace the Rotor Comp. [3].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p>

Cause	Corrective action	Procedure
(iii) The field coil is broken.	Replace the Rotor Comp. [3].	<p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>⑩ Remove the Rotor Comp. [3].</p> <p><b>CAUTION: Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</b></p>
(iv) The rectifier built in the Rotor Comp. [3] is damaged.	Replace the Rotor Comp. [3].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p> <p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>⑩ Remove the Rotor Comp. [3].</p> <p><b>CAUTION: Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</b></p>

Trouble	Cause	Corrective action	Procedure
The voltage drops significantly if any electrical equipment is connected.	The Condenser [145] is faulty.	Replace the Condenser [145].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M6 x 24 [77] from the side of the Panel Ass'y [151].</p> <p>③ Pull the Panel Assy [151] and remove the couplers of the Wire Harness [94] and the Wire Harness [161] from the Engine [71] behind the Box Assy [141].</p> <p>④ Push the Wire Harness [162] in the Box Ass'y [141].</p> <p>⑤ Remove the Hex. Bolt M6 x 12 [147] and open the Box Ass'y [141] a little.</p> <p>⑥ Push the claws of the couplers (above step ③ ) fitted in the Box Assy [141] to remove the couplers from the Box Ass'y [141].</p> <p>⑦ Open the Box Ass'y [141] and remove the Condenser [145] from the Wire Harness [162].</p> <p>⑧ Replace the Condenser [145] fitted in the Box Ass'y [141].</p>
	The main coil or the sub coil is broken or short-circuited.	Replace the Stator [12].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p>
	The field coil is broken.	Replace the Rotor Comp. [3].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p>

Trouble	Cause	Corrective action	Procedure
The voltage drops significantly if any electrical equipment is connected.	The field coil is broken.	Replace the Rotor Comp. [3].	<p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>⑩ Replace the Rotor Comp. [3].</p> <p><b>CAUTION: Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</b></p> <p>Replace the Rotor Comp. [3].</p> <p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Assy [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M8 x 14 [9].</p> <p>③ Remove the Through Bolt M6 x 120 [10] (Model E 43), M6 x 155 [10] (Model E 60) or M6 x 155 [10] (Model E 71).</p> <p>④ Remove the Hex. Bolt M10 x 30 [75].</p> <p>⑤ Remove the Rear Cover [11].</p> <p>⑥ Replace the Stator [12].</p> <p>⑦ Remove the Bolt M10 x 215 [2] (Model E 43), M10 x 215 [2] (Model E 60) or M10 x 260 [2] (Model E 71) without removing the Rotor Comp. [3] from the Engine [71].</p> <p>⑧ Tighten the rotor puller bolt (jig) as a substitute for the Bolt M10 [2].</p> <p>⑨ When the rotor puller bolt (jig) is tightened, the tip of the jig contacts the crankshaft of the Engine [71] and a force is exerted to push out the Rotor Comp. [3] from the Engine [71].</p> <p>⑩ Replace the Rotor Comp. [3].</p> <p><b>CAUTION: Do not drop or scratch the Rotor Comp. [3]. Otherwise, the Rotor Comp. [3] may pop out when it is released from the crankshaft of the Engine [71].</b></p>
	The rectifier built in the Rotor Comp. [3] is damaged.		<p>The connected electrical equipment is overloaded.</p> <p>Check the connected electrical equipment.</p>

Trouble	Cause	Corrective action	Procedure
The Breaker [124] turns off frequently.	The Breaker [124] and the Thermal Protectors [117] [119] are faulty.	Replace the Breaker [124] and the Thermal Protectors [117] [119].	<p>① Remove the three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151] and remove the Screw (W/Washer) M5 x 12 [13].</p> <p>② Remove the Hex. Bolt M6 x 24 [77] from the side of the Panel Ass'y [151].</p> <p>③ Pull the Panel Ass'y [151] and remove the couplers of the Wire Harness [94] and the Wire Harness [161] from the Engine [71] behind the Box Ass'y [141].</p> <p>④ Push the Wire Harness [162] in the Box Ass'y [141].</p> <p>⑤ Remove the Hex. Bolt M6 x 12 [147] and open the Box Ass'y [141] a little.</p> <p>⑥ Push the claws of the couplers (above step ③) fitted in the Box Ass'y [141] to remove the couplers from the Box Ass'y [141].</p> <p>⑦ Remove the Grommet [144] and put the couplers (above step ⑥) in the Box Ass'y [141].</p> <p>⑧ Open the Box Ass'y [141] and remove the Condenser [145] from the Wire Harness [162].</p> <p>⑨ Pull out the Wire Harness [162] from the Box Ass'y [141] and remove the Box Ass'y [141].</p> <p><u>Removal of the Breaker [124]</u></p> <p>⑩ Remove the Hex. Nut [116] from the Breaker [124].</p> <p>⑪ Disconnect the terminal and replace the Breaker [124].</p> <p><u>Removal of the Thermal Protector [117] for GFCI</u></p> <p>⑫ Disconnect the faston terminal.</p> <p>⑬ Release the claw locked in the Panel (1) [114] surface and replace the Thermal Protector [117].</p> <p><u>Removal of the Thermal Protector [119] for twist-lock receptacles</u></p> <p>⑭ Release the claw locked in the Panel (1) [114] surface and replace the Thermal Protector [119].</p>
	The connected electrical equipment is overloaded.	Check the connected electrical equipment.	—
	The starting current of the motor in the connected electrical equipment is high.	Check the connected electrical equipment.	—

## 9-2. Checking Continuity

### (1) Receptacles

Procedure: Turn on the Breaker [124] and the Thermal Protectors [117][119]. Check the entire power receptacle except the grounding terminal for continuity.

Note that the values in parentheses are provided for reference purposes only. For detail, refer to the checking items specified in the next article.

Power receptacle	Select Switch [125]	E43	E60	E71
For GFCI (Ground-Fault Circuit Interrupter) [115] (2 pcs.)	120 V side	There is continuity (0.2 Ω).	There is continuity (0.15 Ω).	There is continuity (0.1 Ω).
	240 V side	There is continuity (0.2 Ω).	There is continuity (0.15 Ω).	There is continuity (0.1 Ω).
For 120 V, 3-pole [118] (Model E 43: 1 pc. Models E 60 and E 71: 2 pcs.)	120 V side	There is continuity (0.2 Ω).	There is continuity (0.15 Ω).	There is continuity (0.1 Ω).
	240 V side	There is continuity (0.2 Ω).	There is continuity (0.15 Ω).	There is continuity (0.1 Ω).
For 120 V/240 V [127]	120 V side	There is no continuity.		
	240 V side	There is continuity (0.4 Ω).	There is continuity (0.3 Ω).	There is continuity (0.2 Ω).

### (2) Resistance of the generator coils

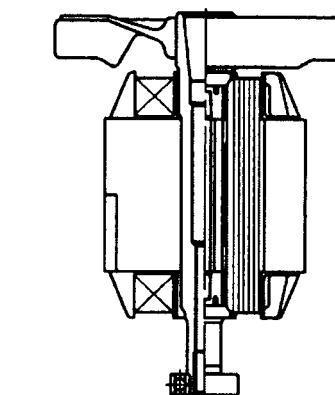

Procedure: Remove the Tapping Screw D5 x 10 [6], End Cover [7] and three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151]. Measure the resistance at the coupler of the wire harness (stator side) when the generator is cold (before operation). Following are the resistance values measured at 20 °C.

Coil	E43	E60	E71
Feed coil	5.4 Ω	6.1 Ω	6.0 Ω
Main coil (white/blue)	0.40 Ω	0.27 Ω	0.16 Ω
Main coil (brown/yellow)	0.40 Ω	0.27 Ω	0.16 Ω
Sub coil (black/black)	1.08 Ω	1.09 Ω	0.49 Ω

For the feed coil, measure the resistance between the start and the end of coil winding as shown below.

E43

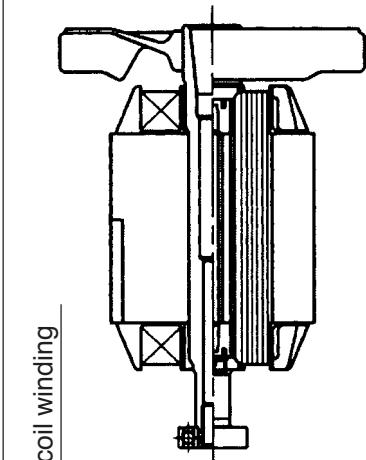

Start of coil winding  
*(S)*

End of coil winding  
*(N)*

E60

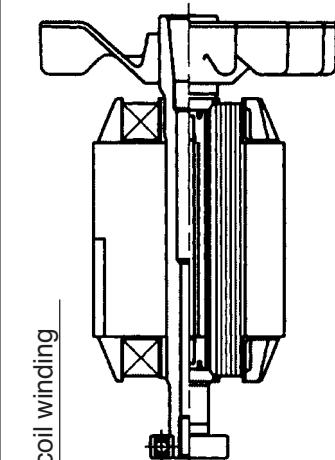

Start of coil winding  
*(S)*

Red line

E71

Start of coil winding  
*(S)*

Red line

### (3) Simple check of the Condenser [145]

Procedure: Remove the Tapping Screw D5 x 10 [6], End Cover [7] and three couplers of the Wire Harness [162] (white/blue, yellow/brown, and black/black) that connects the Stator [12] with the Panel Ass'y [151]. Carry out a measurement at the coupler of the wire harness (panel ass'y side).

After disassembly of the panel ass'y, only the Condenser [145] can be checked in the same manner. Touch the positive pole and the negative pole of the test lead of the analog tester ( $k\Omega$  range) alternately between the terminals of the coupler (between the terminals of the Condenser [145] after disassembly).

Normal: The needle jumps from  $0\Omega$  to  $\infty$ .

Abnormal: The needle remains at  $0\Omega$  or open.

(Reference) Capacity of the condenser

		E43	E60	E71
Capacity of the condenser [ $\mu F$ ]	40 (20 x 2 pcs.)	40 (20 x 2 pcs.)	60 (20 x 3 pcs.)	

### 9-3. Tightening Torque

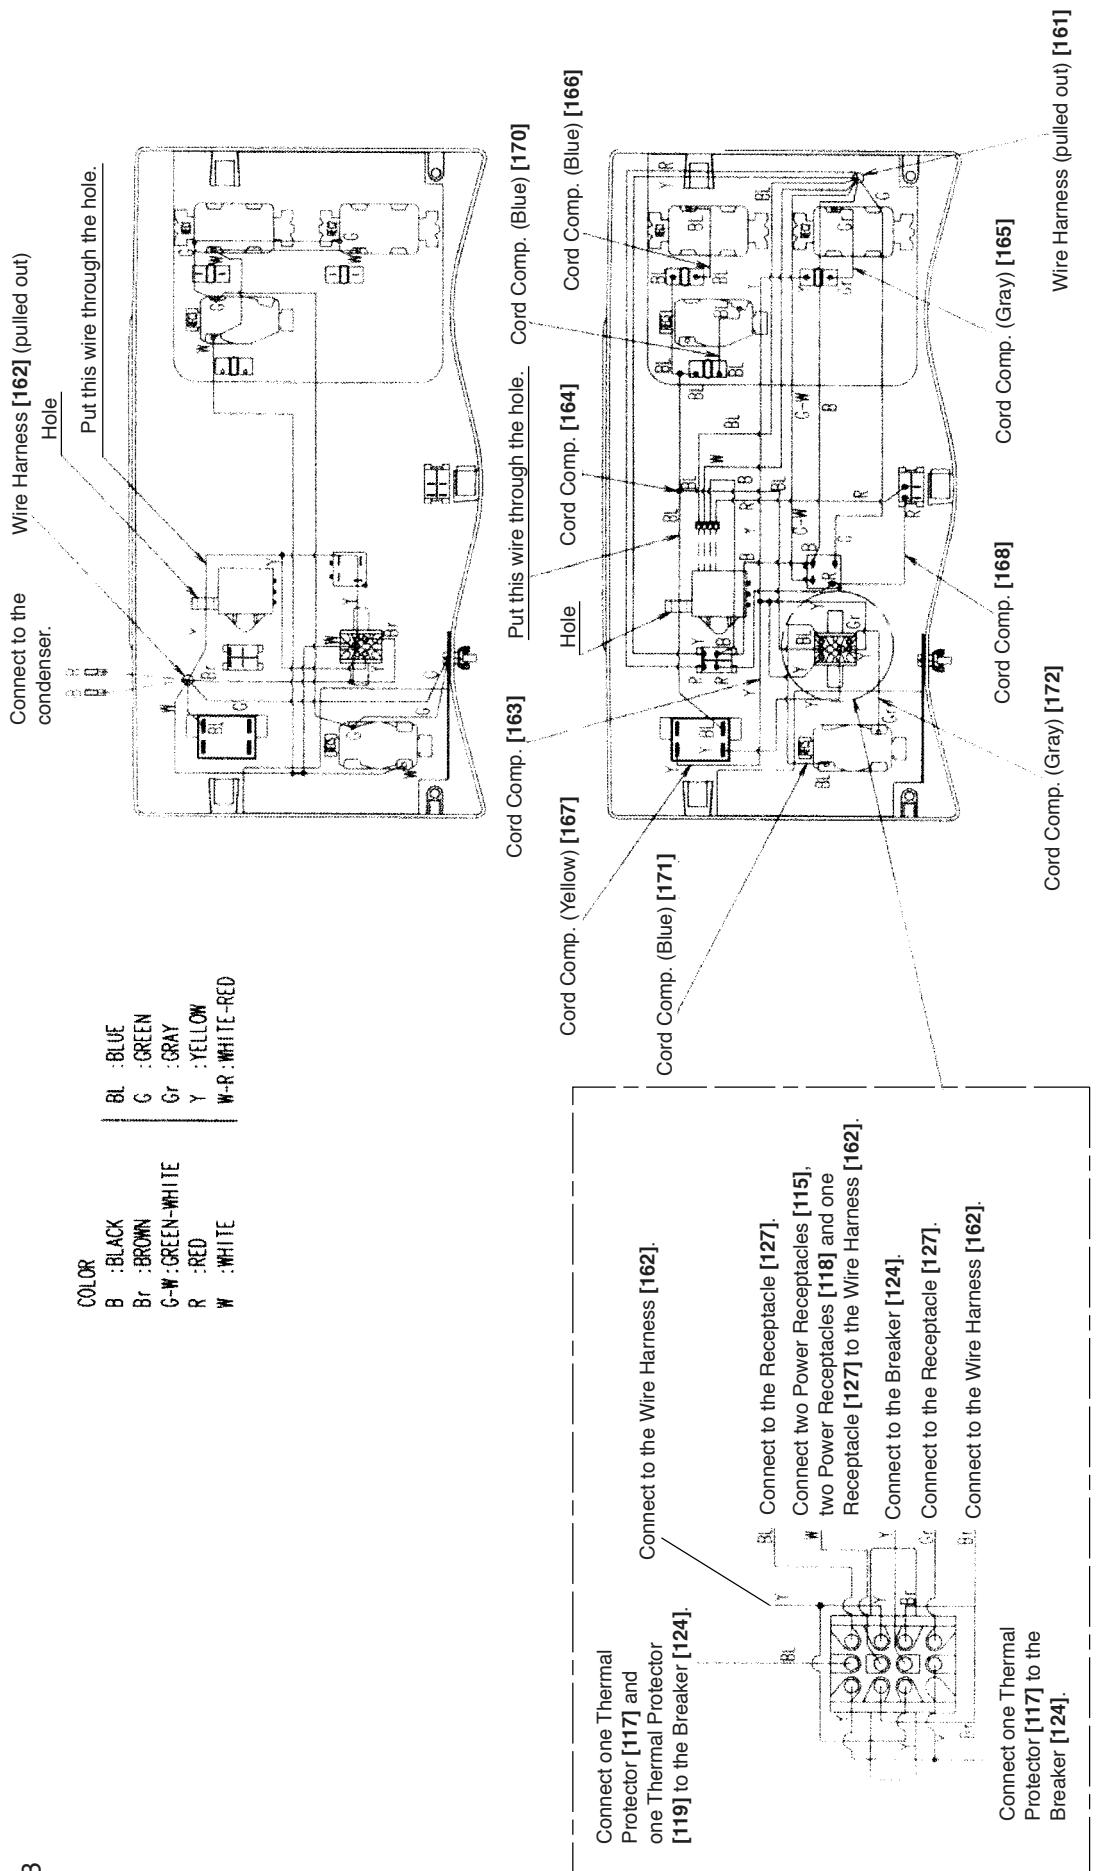

Unit: N·m {kgf·cm}
